1. Bargain in AMSAT operations

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-06-04 11:58:33 UTC
From: rishs
Topic: 1 Message: 1

Welcome to those who may have an interest in the recently introduced Wouxun KD-UVD1 dual band dual channel HT. For the price (range of $108-$130US) you have a great little 2 meter 70cm rig ready made for repeater or AMSAT use. The rig contains multiple additional features including fm radio, flash light, 128 programable channels with easy to use software.
I have no financial interest in the company nor do I sell the HT's. I simply am a ham who enjoys a bargain. This FCC type accepted seems to fit the bill.
K8SAR-Steve

2. FM Radio and HAM Radio RX at the same time?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-06-06 15:32:50 UTC
From: dl4eax
Topic: 2 Message: 2

Hello,

I have read that the KG-UVD1 can RX on two frequencies at the same time.

Is it possible to listen to the FM Radio Band and Ham Radio at the same time?

Thanks,

Michael - DL4EAX

3. Re: Bargain in AMSAT operations

Hi Steve,

thanks for opening this group.

Yes, compared to YAEICOWOOD HTs this is really a bargain.

Let´s see how long I can resist :-)

73,

Michael - DL4EAX

From: Jerry Boyle
Topic: 5 Message: 5

Hi folks, I bought my UVD1. Looking for hints on best way to set up channels. I haven't bought programming software (yet). Tried setting up a channel for each local repeater, then realized memories don't keep offsets, tones, etc. separate. Looked at manual, see need to program Rcv and Tx opposite each other. Manual not a ton of help here. (Chinglish) translation pretty poor. Suggestions from anyone welcome!

From: pma5201
Topic: 7 Message: 7

How does the "Dual Standby" on this radio operate? My assumption would be just like dual receive, but I doubt it has dual radios to accomplish that?

>

You can choose dual receive using the "TDR" button, then enter frequencies you wish to monitor into both A and B positions. It will monitor both freqs with priority to which is currently selected (with A/B button). As to how this is done from a technical aspect, I am assuming it is ancient Chinese magic. Jerry

I might suggest you download the software from the group site, pick up an adapter cable from Ebay and program transmit, recieve, offset etc. Quite an easy process actually.

FWIW, I never tried the programming of channels manually without the software. I bought the programming cable with the rig. With the most recent software I simply entered the tx and rx frequencies for each channel (can be v/u, v/v, u/v, or u/u) along with ctc/dts, transmit power, scan priority, wide/narrow, and any alpha/channel names(used that to tag the satellites by name and doppler shift frequency for the pass.

Thanks, Steve. I guess I will bite the bullet and buy the cable. I also wondered.. How did you split your memory storage. Did you lump everything into one big bank, or did you need to separate VHF on "A', UHF on "B", etc. Only rig I have that is set up with dual receive is my FT-8800 and this is pretty different. Also, I was confused by the gibberish in the manual about the "Co-channel and Dis-channel" for saving repeater pairs.
I got my HT from www.409shop.com and just wrote to them to see if any of the speaker/mikes with the built-in antenna mount will work with this model. Also to see which of the 2 battery packs will fit for a spare battery. I will post this info if I hear back from them. I am in Indianapolis, BTW if anyone is nearby that has the cable already. 73, Jerry

Thanks, Jerry. Same place I got my radio and cable ($12). co-channel and dis-channel totally confused me. As to programming I simply grouped the 128 channels into bunches (my own term) using say channel 1 for 146.52 simplex then 2-30 for various AMSAT birds AO-27, AO51, SO-50, ARISS using about 3-5 channels for each bird to adjust for Doppler. Then I used 31-50 for local vhf and uhf repeaters, 51-70 GMRS/MURS (listening only), then 70-100 local vhf/uhf emergency/service frequencies. I also stuck a weather channel in there as well. Still have balance of the 128 channels empty.
The software allows you to print out your programmed set so I simply reduced the font size and have a little cheat sheet I take with me. Not sure if I simply overlooked it or not but discovered that in normal listening mode you can go to a specific channel by merely punching in the 3 diget channel number....may have been obvious to you but I missed the feature.
I need to better understand the scanning function (priority scan etc) to see if I can limit the scan to specific frequencies (I know that's possible) or groups of frequencies(not sure)
I got the usb cable and not the serial cable

73, Steve

Thanks, Steve. That helps a lot. I will place an order today to get a cable and some other goodies.. I heard back from 409shop today with better info on accessories. I will post this info under a new topic header. I really appreciate you setting up this group for us brave pioneers (read: cheapskates) facing the challenge of using this cool new radio. Oh yeah, how about uploading the photo as an avatar so it will show up on the Yahoo Groups page? Just like the big kids did with the mainstream rigs. 73, Jerry

Just got mine today and am still playing with it. One thing I cannot figure out is how to get it back into frequency (ne VFO) mode after programming with the software. I like programming with software, but would like the ability to enter from the keypad, too. The manual says to hold the menu key and then power on, but it always comes up in channel mode.

I would imagine you could use the "MENU" 21 function to chose "Freq" mode. So hit "MENU" then "2" "1", Then "Menu" and up and down arrow to scroll through freq, freq/channel, channel to "freq", then hit "MENU". This should put you in VFO mode again. 73, Jerry

From: Jerry Boyle
Topic: 18 Message: 18

For those of you looking for accessories for your Wouxun KG-UVD1 handhelds, I thought you might appreciate a list of the items available from www.409shop.com. This is where I bought my radio. I will include today's current prices in US dollars. Shipping is included. I am not affiliated with this business, and provide this only as a reference. There are enough goodies here to assemble a veritable "Barbie Dream House" for your little Chinese wonder radio.

Wouxun Replacement Battery Packs- Two different replacement Lithium-Ion packs are available. The original pack that comes with our radio is 1300mAH. This shop carries a 1400mAH for $15.50 and a 1700mAH for $19.50. Both should fit.

Wouxun Battery Case- This is a replacement battery case that allow you to operate the rig using 5 AA batteries. This is a great idea for anyone needing to operate in emergency situations or remote areas where power is not available to plug in a charger. $11.24

Battery Eliminator- This is a unit that snaps on in place of the normal battery pack. It is hard-wired to a standard cigarette lighter plug to allow you to power the radio directly from your vehicle's accessory jack. $11.50

Wouxun Belt Clip- A replacement belt clip in case the one on your battery pack breaks. $4.65

Antennas- The shop carries a wide range of antennas compatible with the Wouxun. Everything from direct replacement rubber ducks, to the longer whips that have become popular due to their higher gain, to mag mount mobile antennas. Just look for something in dual-band 2m-440 using the SMA-Female connector.

Speaker/Mike- The plug spacing and config. for this radio is the same as Kenwood. One of the coolest options is a unit with a built-in antenna connector that allows you to unscrew the rubber duck, and attach it to the top of your mike, using the included UG74 type cable screwed into the radio's antenna connector. This puts the antenna up where it can do some good while keeping the radio at belt level. $34.00

Headsets, etc.- The shop carries a variety of headset options. Look for Wouxun or Kenwood when trying to choose what might be best for you.

Programming Cable- Use this along with the software downloadable from the 409shop.com web site or this forum's "files" section to pre-program all of your memories and options into the radio. This is WAY easier than manual entry for all this info. The serial-port version is $8.00, the USB is $12.00.

Leather Cases- Two options, both are black leather. One has a separate belt swivel (looks kinda like a mike clip) that the case can snap in and out of. $15.50 The other uses a plastic spring clip arrangement similar to the one on your battery pack to attach the case to your belt. $16.00

It is nice to see that there is a large variety of accessories available to help us personalize these radios. They are well-built and rugged enough that many cities use them for police/fire public service use. Enjoy your rig, and remember to smile every time you hear the little Chinese lady say "zero". I sure do. Jerry

Johan, thanks for the post. I don't see any reason why the ground plane design wouldn't work. Like all things antenna one just needs to pay close attention to dimensions and resonant frequencies. You may also want to look at some multiband J-pole designs. Here's a site to consider... http://ve3elb.ham-radio.ch/2m-70cm%20antennas.html. For satellites I use the Elk log periodic hand held....the Arrow antenna is another that works well for "the birds".
As to accessories....that really is an individual preference. I might suggest you consider a remote speaker mic....Jerry mentions one with remote antenna mounting to get it above your waist. I picked up a 2 wire mic/earphone that works for me working satellites. Depending on use, a spare battery might be appropriate.
I don't intend to favor one supplier over another but CURRENTLY I don't beieve you can beat the prices or selection from the folks at www.409shop.com (have no financial interest in their business or success---just shopping around, I've not found better prices or wider selection).
73, Steve

Johan, in rereading my response I failed to note you posed the question under the subject "Amsat Bargain". I'm sorry I didn't respond if you were asking the question about the effectiveness of the ground plane for satellite communications. If that was the question I'd have to answer that a ground plane with an HT to work the satellites would be, imo fairly problematic. While possible, I would think it clearly less effective than the stationary "halo" antennas for 2 meters and 70 cm. Additionally, neither of these 2 options (plus j-pole) would be near as effective as combined 2 meter 70cm beams. While there are a number of construction articles for inexpensive AMSAT beams on the web you can buy the Arrow or Elk hand held beams for somewhere in the $110-150US. With these antennas there are hams working the satellietes with less than a watt of power.
Hope this is responsive to your question

Thanks for the post. You're looking at tx/rx capability on 136-174Mhz and 400-470Mhz. Easiest thing to program the 128 channels is to get the programming cable (I use USB) from the www.409shop.com folks ($12 including shipping), download the latest free programming software from the files section on this site and program away.

28. Power Output

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-06-12 22:34:41 UTC
From: n6mon
Topic: 28 Message: 28

Has anyone checked their radio on a watt meter yet? I just did and with a freshly charged battery, I am only getting 2 watts on VHF (specificed as 5W) and less than 2 watts on UHF (specified as 4W).

Receiver sensitivity on both bands is a low, also. VHF is about 1.5 microV for 12db sinad and UHF is around .9 microV.

Mod and frequency are within tolerance and narrow mod is 2.5kHz. Narrow band does NOT change the receiver bandwidth, so using in a narrow band environment will result in lower receive volume.

Thanks for the post. You prompted me to check the output on my KG-UVD1(new $117 including shipping) and do a direct comparison with my Yaesu VX-7R(Ebay used bargain for $250) on my SWR/PWR meter. With the KG-UVD1 I get 4 watts on VHF and slightly more than 3 on UHF. The VX-7R gives me 5watts on VHF and 3 watts UHF using the same meter and configuration. FWIW I have used both for AMSAT operation and get full quieting and the same reports with both.

35. charger problem

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-06-14 14:09:36 UTC
From: Bernd Maestling
Topic: 35 Message: 35

I just received my new UVD1 last week, what is indeed a very good radio, the only negative thing is the missing DTMF functionality. I hope WOUXUN will add this feature soon. I miss DTMF because I'm using it all the time for remote controlled repeaters and EchoLink.

My problem.
I have the delivered Li-Io battery charger (12V model with a 12V/1000mA switching power adapter) but have big problems to recharge my batteries. I use the original 1400mA/h and two 1700mA/h batteries and none of them want to charge anymore.

The first cycle (the first charge this week) was ok for all three batteries (solid red LED) but now the light is only blinking red for more then 10 hours and the battery will not be charged. It's no matter if I use the 1400mA/h battery or the 1700mA/h one, same result. Only red blinking, no charging.

Is the charger or maybe all batteries defective ? The UVD1 didn't tell me, as stated in the manual, that the battery level was low, it switched off during transmission with both batteries.

I checked the charger as well as the power supply but everything seems to be ok. I can't check this tiny little circuit on the bottom, I know what it is doing but I don't know what it is ;).

Any ideas ? New chargers are very cheap on ebay, so I ordered a new "dual-slot" one, but what if the batteries are dead (all 3, brand new at 1 time ?)

From a little research it looks like this is a nonissue and pretty routine for comodo. See http://forums.tigsource.com/index.php?topic=5731.0;wap2

I own 4 single band chinese radios. I'm thinking of converting to two of the dual band radios. The problem has always been the antenna. The center of the band is typically far from the ham band. This means poor performance on the ham band. I have bought after market antennas designed for the ham band. Performance has greatly improved. Has anyone tested the antenna? What kind of connector is on the antenna? Has anyone found a compatible dual band after market antenna?

I'm wondering if someone can help me out here. This is my first rig, I only got my license 2 weeks ago. I had some of my local repeaters hand programmed (or so I thought) but it always broadcasted simplex. So I got the cable today and already had the program (in anticipation) with all the channels and frequencies typed in. I tried to program it but it always says "failed connection". I've tried every com port option on the programming software but to no avail. When I check the manual the closest I can get is a "how to clone" section but nothing on using the programming software as well as now FAQ's. Can anyone help?

Michael, welcome to the group. Not sure I can help but a couple thoughts.....The programing software (v 1.04) along with the USB cable worked for me on the KG-VUD1 right from the start. Are you using the usb or serial cable? With my VX-7R I went through multiple serial cables and for whatever reason I could not get the computer to communicate with the Yaesu. Switched to a USB version and worked fine. Are you using the usb or serial version? Here's a web site that may have details on what to try...
http://www.computerhope.com/issues/ch000247.htm to perhaps solve the com port conflict.
Best of luck.

Hello everyone. I'm trying to program my UVD1 but everytime i try i get a failed message. I have COM1 available but it shows as com2 in the software. I've tried it and can't get it to work. I've also tried a USB to com adapter and the same happend there. The com port in the software is always one higher than the actual com port on the pc. I've tried it in two different PC's and still can't get it to work with the same problem on both. I've tried a 9 pin serial and a USB to serial.

Help

Welcome to the group, Simon. A couple thoughts on your question 1)Are you using Vista as the operating system as opposed to an earlier Windows version ie xp or Win 2000, There have been some thoughts that Vista could be an issue. 2)My experience, perhaps pure luck, has the software (version 1.04) on my Win XP computer through a usb port(not serial or serial with adapter)operating flawless right from the start. With the Yaesu VX-7R and program software I had Com port problems using a serial adapter and Vista computers. Just some thoughts.

Thanks for the message, Johan. Not 100% sure of your question. If it is"can we have 2 separate channels programmed with the same frequencies?" The answer is yes. If it is "does the programming software have the ability to cut/copy entries from one channel to another?" I do not know that answer and have not tried as it is simple just to enter the data on Channel 120 that you originally entered into Channel 1. Hope this helps.

FYI the charger is now repaired.

The SB772 in the charger (PNP voltage regulator) was dead.
Normally there should be a bigger one inside but WOUXUN
used a smaller, cheaper one. I replaced the Transistor and
all seems to be ok. Will see if it'll be dead again when
chargin the 1700mA/h batteries. Fortunately I have a few
spare Transistors now ;)

63. Setting offset/ctcss for memory channels without software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-07-02 12:37:25 UTC
From: n4kwo
Topic: 63 Message: 63

I just received my KG-UVD1 and I am pretty impressed with it overall. Receive audio sounds better than my VX-7 and sensitivity is as good if not better on 2 Meters. I did not purchase the programming cable but plan to and have been trying to setup manually. Whenever I store a frequency to a memory channel after setting up the offset and ctcss, the offset and ctcss are not stored. Has anyone cracked the secret in getting in memory?

Kirk

Thanks for joining the group. Afraid I can not help with the "freezing up" issue you are experiencing in manual programming. Perhaps others in the group have had similar experience and can offer some insight. As to the programing cable......usb plugs into your computer while the dual plug plugs into the mic/earphone sockets under the cover on the side of the rig. See page 6 of the manual. Best wishes.

Steve,

Thank for the response. Setting the offset and ctcss works fine in frequency mode, its only when you set the memory channel and the offset and ctcss is lost. The frequency does get stored in memory. Sounds like this is not a problem when using the software.

Great idea !! I am going to place an order now. Anyone for a Carolino
DB-MARK I ??
The strange thing is that, for example, in Spain the price for the Wouxun
and for the Dynascan is the same!
Maybe marketing strategies .

Hi Steve,

The Hardware is ready for DTMF but not the Software !
Its the same hardware as KG-699G.

When ANI-ID Transmit Switch is posible in the Future ,y not DTMF :)?

Kirk, I believe the offset and ctcss you set in frequency mode are dissimilar to the functioning of the tx and rx channels in channel mode. The offset spread under freq mode can be a max of 69.95 Mhz which, when set, functions fine on frequency mode however I believe under the channel mode you need to specificly set both the tx and rx frequencies (including ctcss) within the channel itself. See page 28 of the manual as it may help. With the software programing, the concept comes through very obviously and requires you to actually enter tx and rx and tones with in each channel. Hope this helps.-

Steve,

You are indeed correct that the offset and direction are ignored when storing memory channels from the keypad. You must store the receive and transmit frequency individually and the transmit ctcss you have set in frequency mode will be stored with the transmit frequency. The secret is in storing the frequency using Menu 27 on page 34 of my manual. If you hit the Menu key once then exit after setting the frequency you are storing the receive frequency for the channel. If you hit menu twice then exit you are storing the transmit frequency for the channel.

Thanks,

Kirk

There are a few on ebay in the $120-$130 range. Be alert as some listings reflect KG-UVD1P but on closer examination of the write up and emailing the seller you find they are not the "p" model and do not have DTMF.

I have my Pro model and it is working to the best of my knowledge.
I have tried the DTMF encoding and it performed as expected.
The unexpected feature is that it now will return to VFO mode when you press the menu and then the TDR button. Unfortunately you still have to go through the menu 21 function to get it back to channels .
It now has ani but not sure if it is working . I know that when I turn it on it send out the numbers that you may have setup but I have not been able to detect numbers sent by someone else.
All in all I like the radio.

Can someone interpret what is being said about the new "p" model's features on http://www.chinatwowayradio.net/viewthread.php?tid=85&extra=page%3D1 ? Am awaiting delivery of the "p" model.

same thing here just out of the blue not tx or rx on vhf they said send tha radio part only back to hong kong
 no mention of repairing it or sending a replacement when the radio is clearly under warranty.

I've had my UDV1 for a couple of months now and so far it's been perfect. I just picked up my radio and i have no TX on VHF but i do have RX. On UHF i have no RX or TX.

I tried a factory reset but no luck.

Any ideas?

Simon

The "p" model is beginning to show up on ebay from a variety of HK sellers. I have one coming from "happyhamshop" at best price thus far ($122.00). To include DTMF and a couple upgrades that arn't real clear just yet. I have no interest in or relationship with the happyhamshop vendor. Will be glad to share experience and first impressions upon receipt.

At the risk of continuing a discussion that probably has gone on too long already, I do have a question. I apologize for asking, however..... I may just be incredibly ignorant but if U.S. licensed hams can build our own gear or re-purpose commercial gear (which we can), why is type acceptance such an issue? Yes, we're taking responsibility when we're using this (or any piece of equipment) for assuring accuracy and operation within the rules and regulations but if I can run an old piece of Motorola basiness band gear on 2 meters or build my own HF xmtr from scratch for 80-20, I'm not sure why the Commission would be breaking down my door for importing a Wouxun. What am I missing?

Very important information before you Order and get Stuck Big Time.

Wouxun and all of the shills are talking about the so called "New Wouxun KG-UVD1P, if you check the Wouxun web site they have been touting that the Wouxun KG-UVD1 has DTM encode and decode for the last two months, NOT TRUE.

If you are thinking of getting a Wouxun KG-UVD1 or even the so called Wouxun KG-UVD1P BE AWARE that 99% of the sources are only sending out Wouxun KG-UVD1 units (3 delivered to friends this weekend and yet ALL SOURCES ARE CLAIMING that radio will do DTMF Encode, IT WILL NOT and as of this date NO UPGRADE IS AVAILABEL FROM Wouxun.
If you check the Wouxun software page they now have two separate programming software and even separate user manuals with the claim that the .5 is only for the Wouxun KG-UVD1P.

I THINK THAT ITS TIME TO LOOK TWICE ASK QUESTIONS (hopefully get some TRUE answers) before you spend your money.
DO NOT BELIVE the shills or the DEALERS my friends ordered their radios only 10 days ago and got KG-UVD1 units NO DTMF ENCODE.

Hi all,

Just received my new KG-UVD1P and can't seem to get my XP machine to recognize the radio. I installed the kg-uvd1p software from the Wouxun web site. I installed the driver from the disc that came with the radio. I went into device manager and changed the comm port to com1 (as per the readme file on the disc)I checked that com1 was selected in the software. When I try to read from the radio I get the pop up error message "failed connection". Does the radio need to be put into the program mode by pressing some key during power up? What am I missing?
I get the same error when I try to write a file to the radio.

BTW I was shipped a "P" model and the DTMF does work.

I can't give you specifics on the radio as I am now one of those awaiting delivery to see If i get the DTMF.

But I am an old school field service tech from old days before USB.
I would not expect com1 to work, it should still be mapped into the system and not available....try port 3 off the top of my head.
In the mean time, please what or who did you buy your radio from?

Thanks for the help.
Com 2 worked on my laptop and I had to use Com 3 on my desktop.
So much for reading the "readme" file on the disc.
I purchased the radio from Solidradio on e-bay.
I ordered last Tuesday and received today.
Less than one week from Hong Kong!!

Thank you for your post. If you have the information please advise of the Wouxun web site where the manufacturer claims the KG-UVD1 has DTMF capabilities. I have not seen such a claim by the manufacturer nor have they claimed same in any emails I've exchanged with them. Additionally, it is important to clarify the actual radio you are buying. I have seen some Ebay auctions whose heading shows KG-UVD1P but all of the details in the description points to just the UVD1 rig(read carefully and ask questions if you are not sure). As to the user manuals.....a couple pages differ (I believe like pg 39) from the UVD1 manual and that is as it relates to the ANI and DTMF functions. If you have specific information as to dealers clearly advertising UVD1P but not delivering then do the group a favor and be specific. Thanks for your time and interest in our group.

K8SAR,

If you look at the uperr right side of the Wouxum Web page you will see the following:

Some may attempt to explain it as only a listing of items" or some form of cultural misunderstanding but many individuals have looked and interpreted the information as a fact that the KG-UDV1 has DTMF encoding, why not it has 1750 listed and it works on the D1.

This has been up on the page for the last three months that I can recolect and it states "Completely New Function" , Not new Radio but FUNCTION and highlighting 1 Dual band (KG-UVD1) with other features below.

Try explainig that.

The Shills have been pointing this out to potential buyers as 'Direct from the Factory"

BTW I do not see them advertising the KG-UVD1P?

Its nice that you have a email rapor with Wouxum, they just do not answer any emails from me, I wonder why! hi hi

To many sellers for me to chase down and warn everyone about.

It is Simpler to just AVOID ANY RADIO that HAS the KG-UVD1 or even looks like it until (a) Wouxun makes good on what it put on the web page (b) all of the KG-UVD1's are purged out of the system and its safe to purchase anything with a Wouxum KG-UVD1(P) name .

Actualy I think that Wouxun is working on that plan since some one indicated that someone is selling what looks like a KG-UVD1 with a "new name" so we have to watch even more.

What a bummer ant it looked like a nice radio for Hams , I will no longer purchase anything from a China manufacturer who misdirects on a web page in such a way

AB2ET

Completely New Function

1. Dual band (KG-UVD1)

2. 8 Groups Scrambler available

3. DTMF encoding and DTMF decoding

4. CTCSS can set discretionarily

5. 5/2 Tone and 1750Hz tone

> >
> Thank you for your post. If you have the information please advise of the Wouxun web site where the manufacturer claims the KG-UVD1 has DTMF capabilities. I have not seen such a claim by the manufacturer nor have they claimed same in any emails I've exchanged with them. Additionally, it is important to clarify the actual radio you are buying. I have seen some Ebay auctions whose heading shows KG-UVD1P but all of the details in the description points to just the UVD1 rig(read carefully and ask questions if you are not sure). As to the user manuals.....a couple pages differ (I believe like pg 39) from the UVD1 manual and that is as it relates to the ANI and DTMF functions. If you have specific information as to dealers clearly advertising UVD1P but not delivering then do the group a favor and be specific. Thanks for your time and interest in our group.

Subject: [Wouxun_KG-UVD1] Re: WARNING Wouxun KG-UVD1

K8SAR,

If you look at the uperr right side of the Wouxum Web page you will see the following:

Some may attempt to explain it as only a listing of items" or some form of cultural misunderstanding but many individuals have looked and interpreted the information as a fact that the KG-UDV1 has DTMF encoding, why not it has 1750 listed and it works on the D1.

This has been up on the page for the last three months that I can recolect and it states "Completely New Function" , Not new Radio but FUNCTION and highlighting 1 Dual band (KG-UVD1) with other features below.

Try explainig that.

The Shills have been pointing this out to potential buyers as 'Direct from the Factory"

BTW I do not see them advertising the KG-UVD1P?

Its nice that you have a email rapor with Wouxum, they just do not answer any emails from me, I wonder why! hi hi

To many sellers for me to chase down and warn everyone about.

It is Simpler to just AVOID ANY RADIO that HAS the KG-UVD1 or even looks like it until (a) Wouxun makes good on what it put on the web page (b) all of the KG-UVD1's are purged out of the system and its safe to purchase anything with a Wouxum KG-UVD1(P) name .

Actualy I think that Wouxun is working on that plan since some one indicated that someone is selling what looks like a KG-UVD1 with a "new name" so we have to watch even more.

What a bummer ant it looked like a nice radio for Hams , I will no longer purchase anything from a China manufacturer who misdirects on a web page in such a way

AB2ET

Completely New Function

1. Dual band (KG-UVD1)

2. 8 Groups Scrambler available

3. DTMF encoding and DTMF decoding

4. CTCSS can set discretionarily

5. 5/2 Tone and 1750Hz tone

111. My new purchase

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-07-24 20:13:23 UTC
From: jlb775
Topic: 111 Message: 111

Hi Guys. Just wanted to share my experience in acquiring this radio as reference for any other new hams (like me)trying to get this radio. It's not over yet tho as I still have to receive it.

I'd been watching, reading, and following this group before I started any searching. I contacted all the sellers on ebay via message and latched onto the first one that responded, which was within about 2 hours of my question (all the others took DAYS to respond) Note: I did not contact him thru ebay but thru contact info via a website.
I'm a night owl and I work nights witch worked out well what with the time difference as once started it all worked fast.
I started negotiating by telling him that another seller on ebay had the radio listed for $5 more - same shipping- but with the USB data cable included. He agreed to match it. What ensued was a bunch of messages back and forth almost as fast as a chat. I made sure he pointed me to each and every correct accessory I was adding that would work with this radio as his descriptions were lacking. I was not going to worry about whether or not I got the cheapest price but only that I got what I could afford from a reliable seller and that was willing to negotiate.

I made the purchase about 12 hours BEFORE the first warning post showed up here regarding people not getting the correct "P" version. After emailing him about this scam, he assured me yet again that I would get the correct item.

Normally a buyer, in a case like this, would demand an adjusted invoice before sending payment, but with the cultural differences and language barrier I figured I would have a hard time explaining so I took a leap of faith and transferred the money directly from my paypal account to his. Which means I took the concept of caveat emptor - buyer beware - and threw it right out the window.
I do things like that...

I got notice that my order was shipped on July 23. With a 7 to 14 day posted delivery estimate. Thumb twiddling time.

****

For the requested item, total is USD145: (total with shipping)

1 Wouxun KG-uvd1p radio
1 USB data cable
1 AA battery pack
1 antenna adapter to use for BNC antenna.
Thanks and regards,
George

John

I just received the "p" model. It is identical in looks and operation to the -UVP1 that I've had for a couple months except for the DTMF feature. I can't really justify owning them both (along with a VX-7R). Like new and in all original packaging. Will part with it and ear piece mike for $75US including domestic shipping. Would prefer Paypal. If anyone is interested feel free to contact me offline.

73, Steve

114. Dealer Operation Mode

Topic: 114 Message: 114

Info below is from the chinatwowayradio web site. Quite interesting.

KG-UVD1P Dealer Operation Mode
When you are in the open or computer and programming cable are not at hand, you can change the high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth and parameter on every channel through the dealer operation mode.
Operation Method:

Holding on [8] key and powering on the transceiver at the same time, then inputting password "268160", the transceiver enters dealer operation mode.
When you are changing the above parameters on channels, please firstly call out the channel that will be changed, and set it as the master frequency through [A/B]. Then you can change the parameters of high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth .
SAVE & EXIT: Press [MENU]+ [A/B].

115. 220Mhz operation possible?

From: Paul Mathews
Topic: 115 Message: 115

I noticed that in the description of the KG-UVD1P it says that frequencies (TX/RX) can be changed for different countries/areas, including 216-280Mhz. After looking on the chinatwowayradio web site, it appears that people have been able to change frequencies as far as 130-199.9875MHz and 400-518.985MHz. From the looks of things, it seems this could easily be expanded to cover 220 as well. Is this actually possible?

I don't believe that is correct. I have the P model and when the information was provided to broaden the bandwidth of the radio, I decided to try it.
I changed the value from 136470 to 130470 and when it rebooted it was still the same as it was when I started.
I also tried it with the UHF side by trying to expand it and no joy.

> At the risk of continuing a discussion that probably has gone on too long already, I do have a question. I apologize for asking, however..... I may just be incredibly ignorant but if U.S. licensed hams can build our own gear or re-purpose commercial gear (which we can), why is type acceptance such an issue? Yes, we're taking responsibility when we're using this (or any piece of equipment) for assuring accuracy and operation within the rules and regulations but if I can run an old piece of Motorola basiness band gear on 2 meters or build my own HF xmtr from scratch for 80-20, I'm not sure why the Commission would be breaking down my door for importing a Wouxun. What am I missing?
> Jack Neal-W8AQ
>
Will Jack I'm with you on this!
I'm thinking here about NON-Ham's can not buy these radio's
As a Licensed Ham, That can Re-map any radio, That's "ANY-RADIO" for use
on the Ham Bands is OK with the FCC as long as you fully tested
these radio's to make sure they confirm with the FCC Rules & Regs,
the main point is do they TX on Frequency and not cause interference
with other radio services.

Please lets leave it at that!

120. kg-uvd1p battery capacity indicator doesn't change

Is the battery capacity indicator (upper right corner of LCD display)
supposed to change as the battery runs down? I ran the battery dead the other day and the indicator showed full until the radio turned itself off. I also never got low battery warning before it died. My workaround is to change the power-on message to "BATT-V". A fully charged battery is 8.4v and a dead battery is 7.1v.

Noticed the same on my two KG-UVD1's (Not P)

Battery indicator shows full bars withn a quick jump to one bar right before battery "death" this with the stock and 1700mha Battery.
NO LOW BATTERY WARNING OF ANY KIND, and Yes warning is checked in the software.
L
Looks like I will have to do what you did to get status.

Just a reminder:
If you are going to get a KG-UDV1-P (WITH DTMF) make sure that you have a way to get your $$$ back from the vendor if they ship you a KG-UDV-1.
Funny I noticed that one of the members was selling his for $75.

126. Wouxum KG-UVD1 (P) Scary Saga

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-07-29 15:05:23 UTC
From: ab2et
Topic: 126 Message: 126

In the last few days a number of individuals, including the writer have received emails from various radio "vendors" touting the arrival of the "New KG-UVD1 (P) Professional radio which has DTMF encode and 1750 tone and NEW U/V capabilities.
I have referred all to the Wouxon Home page,and asking them to explain how can the (P) have the features when Wouxon is claiming that the KG-UVD1 has the features in place already?

If you will notice on the Wouxon home page (http://www.wouxun.com/) (right side) they are still listing like they have for the last 2-3 months that the KG-UVD1 has :

Completely New Function
1. Dual band (KG-UVD1)
2. 8 Groups Scrambler available
3. DTMF encoding and DTMF decoding
4. CTCSS can set discretionarily
5. 5/2 Tone and 1750Hz tone

Many users have fallen into this "Bait and Switch" Trap by purchasing a KG-UVD1, it is not the vendors fault it is WOUXON's the vendors just used it to their advantage.

As it is presented to the viewer the statement is claiming that the KG-UDV1 has all of the listed "Completely New Function".
On delivery one discover that the (KG-UVD1) HAS NO DTMF encodes and DTMF decoding as stated on the Wouxun Home Page (Many Vendors have referred users to this page as PROOF that it has).

As well many users have discovered that the KG-UVD1 has a number of deficiencies from its claimed abilities, low battery function, TDR and other items are not functioning correctly with NO word from Wouxum on even an acknowledgment never mind a fix.

I have looked at the new KG_UVD1P page and I find some items a bit SCARY to put it mildly.

They are claiming that the "P" aside from the normal 136-174MHz and 400-470 MHz coverage it has 216-280 MHz capability, in what MODEL I ask, how do you set this up the manual is very murky to say the least, is this more "Bait and Switch"?

A number of my radio club members have called me asking me if this is true, they have gotten emails from "vendors" claiming that this "New Professional Model" and as stated on the Wouxum on the KG-UVD1P page that this radio is capable of any combination of V/U pairings and that this is the answer for the 220 MHz users and that you can easily switch this capability.

Now I love the "Digital FM", HD Radio? any one care to take a stab on that one?

My advice has been to AVOID THE WOUXUN KG-UVD1, KGUVD1P like the plague.
The new features and operational claims look like more of the same "Bait and Switch" just like they claimed in the KG-UVD1 and that the next version of the KG-UVD1(X) is in the pipeline (available shortly) and will actually have all of the claimed functionality, can I

sell you foundation stone from the Brooklyn Bridge?.

Sorry members that we seem to be making all things quite complicated. The KG-UVD1 Wouxun 2 band radio is essentially the same as the KG-UVD1P model simply without the DTMF function. If there are unscrupulous sellers on Ebay that are claiming otherwise they are simply incorrect. Additionally, there are no confirmed reports that the unit will receive or transmit on 220 mhz. I regret the confusion that may exist out there.
Like any E-bay member/buyer deal only with sellers having confirmed positive feedback. When in doubt about a particular listing ask the seller to clarify whether they are listing a D1 or D1P model(I have been even more specific to ask for confirmation of DTMF capability).
If any members have knowingly been deceived by an ebay vendor please share specifics of the transaction, item# and vendor name. Additionally I have generally found Ebay cooperative in resolving misleading sellers.
Finally, as the member who recently sold the D1 for $75 let me clarify that I did so following my purchase of the "P" model. The "p" model was not available at the time I purchased the D1 and following receipt of the "p" model I had no need for both rigs. Just clearing up any possible misunderstanding.

There is another way to change power level in channel mode: in my manual on page 16.
While transmitting press the TDR button to change power level. This level will remain till you switch off the transceiver or change frequency (channel).

I tried your suggestion in VHF and UHF mode- it did not work. I found if you change to the frequency mode you can change the power level.

Maybe it works only with UVD1P version like I have. In the manual UVD1 the option is not described.
Hans

131. Radio/antenna test results

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-07-30 14:23:59 UTC
From: popbolter
Topic: 131 Message: 131

Here are my bench test results for the radio:

Forward power into a dummy load

VHF low power= 1.1 watts VHF high power= 4.8 watts
UHF low power= 1.2 watts UHF high power= 4.2 watts

Stock antenna SWR test

VHF= 4 to 1
UHF= 2.6 to 1

I must say I am impressed with the output power. This is the highest output I've seen from a radio using a battery. Most handhelds perform at 20% less output when using the battery and 100% output when using a DC battery eliminator.

The antenna- poor performance for the U.S. ham band. Like the other stock Chinese antennas I have tested, they perform poorly on the U.S. ham band. The antennas are designed for a large spectrum and our band is too far from the center frequency. I have found great aftermarket single band antennas for my single band radios for about $10. I will test some dual band aftermarket antennas and let everyone know when I found one that has decent performance. Let me know if you found one!

Richard

Cool tip. I missed that when reading the manual. Works fine on my "P" model.

Does anyone knows the procedure to open the frequencies on the KG-UVD1? Mine came closed TX/RX 144-145.995 and 430.000-439.995.

Many thanks in advance.

Carolino

I bought a USB cable at e-bay: http://myworld.ebay.co.uk/radiofactory/
It was delivered with driver cd. Costs: GBP 9,- shipping included. That is about EUR 10,50 or USD 15,-.
Works fine with software KG-UVD1P105(from Wouxun website)and my UVD1P.
I use WinXP home edition on an notebook.

139. Problems with USB dongle and Vista

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-08-01 15:37:06 UTC
From: ve3rtj
Topic: 139 Message: 139

Howdy;

I received my P version in good order, came with the USB cable and software. I downloaded the P version software, and it runs fine. I installed the USB driver on the CD on an XP computer and I can read and write to the radio successfully.

The computer I'd prefer to use runs Vista. Apparently there is no native serial support in Vista, so while the USB driver installs successfully, it doesn't work with the software. I checked the Prolific webpage (the dongle manufacturer) and got their release drivers, with the same results.

Anyone else having a problem programming their KG-UVD1P with Vista? Any suggestions?

Worst case, I can edit on my Vista, and program on the wife's XP machine.

Cheers --

VE3RTJ, Ron

PS: DTMF works just fine, and I think the Digital FM radio is kinda cool. :-)

I for one, got a P version running fine under vista. Did you make the necessary changes to your port settings in Device Manager? It won't work until you do so.

Yup, I had to make that change to get it working under XP. On the Vista machine - a Dell XPS notebook - after installing the usb driver, when I plug in the USB programming cable I get a message about vista being unable to install the software for my new usb device. Does your Vista computer have a serial port? My notebook doesn't. Seems that since the motherboard had no requirement for serial port drivers, Vista didn't add any to the OS on my installation. That's my theory, anyway. If your installation went well, and you have hardware serial ports on board, I would think I'm on the right track.

Thanks;

No, I don't have any serial ports on my pc. Did you install the usb driver BEFORE you plugged the cable in? You usually have to do the driver first. Try this; open device manager w/o the cable plugged in, watch while you plug the cable in and see if a new device category shows up called Ports (comm & lpt) or see if a driver shows up with that yellow exclamation point as an unknown driver. You can do that w/o radio connected. If it does show up & it still don't work, try clicking on uninstall and re-istall the driver. It shows up for me as "Prolific USB to COM Port". Hope that works for you. that's the "virtual" serial port

From: kennethheld
Topic: 143 Message: 143

I've had my UVD1P for a few weeks now and have mostly used it to receive. I have been happy with it so far. I tried the transmitter today and found the transmit audio to be very weak from the built in microphone. (yes I know where the mic is located and spoke directly into it) I also made sure the mic hole was not plugged. The audio is fine when using an external earpiece/microphone. Is this normal for these radios? or is mine defective? Has anyone tried an external speaker mic with one of these? Did it work O.K.? That may be a more permanent solution to the audio problem. The external earpiece / microphone is kind of flimsy for day to day use. I'm assuming it would be cost prohibitive to send this radio back to Hong Kong for warranty repair. Anyone had any experience with that? I got mine on e-bay from solidradio.com

I got mine from Solidradio as well, so probably close to the same production run. I've had no issues with Tx audio. I haven't actually measured the deviation (yet) but it sounds fine. I'm sure you've confirmed that the radio is set for wide; setting it for narrow sets the deviation for 12.5 khz bandwidth instead of 30 khz, and turns the deviation down to +/- 2.5khz instead of the normal 4.5 khz. I don't think you'd notice a difference on receive, this setting only seems to affect the transmitter. That's one of the things I'm waiting to confirm on a service monitor.

I have confirmed that the radio is set for wide. I'll check it on a service monitor. It sounds like the mic element is bad or the mic gain is set to low.

149. in 2 m band transceiver is freezing

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-08-10 16:18:14 UTC
From: Eduard VINTILA
Topic: 149 Message: 149

Hello,

I have a problem with the Wouxun Kg Uvd1 recently purchased from 409 shop.com. In 2 m band after 1-2 min TX and Rx transceiver is freezing. Keypad and keys works but I cannot receive and transmitted. In 400-470 MHz (PMR band) radio works very well.

I suspect some problems with software because sometimes when I try to change working mode, the transceiver reboot.

Can you help me?

Hi all,
exactly the same Problem. Win XP SP3, kg-uvd1p.exe v 1.05 with the usb adapter (purchased with the radio (P version) - it is a prolific 2303 usb-serial) and the usb driver from wouxun page. The programming sw shows always a COM port by 1 higher then the COM used by usb dongle (as set in device manager). Several reinstalls and drivers tried already. No connection to radio so far.. Spent 3hours with this already... a pity.

I did not used the software yet , my KG is on its way to me.
I have some experience on this matter, you can select in the software the com port that you want to use.it is a small software on the net that can hepl you to check your interface , named "Cable test" . In the worst case you can change com port for your interface in the Device Manager.That software (small)will check the commnunication with PC to your interface.
If you can not find it just let me know and I will send it by e-mail to you. I have used that for my FT899 , VX-6r and IC-7000 when iI was not sure about communication loop

I just set mine up using XP SP3 and initially had the same issue - COM port in software was 1 higher than the adapter. I went to control panel, system properties, hardware, device manager and found the prolific adapter in the ports section - it was set to COM11 by default. Using the advanced tab I set it back to COM5 which the software indicated. Restarted PC and it connects up every time after that.

From: ivarpito
Topic: 153 Message: 153

Hi, we've tested the dtmf and the decoding at the repeater side is very unreliable (much less than with other radios). The experts there are saying the tones generated are very short (maybe within the norm for such tone lenght but too short for software decoders used in the repeater). Is there any trick to set the dtmf tones duration longer (e.g. 100-300mS)?? Pito

Wide. Narrow is for 12.5khz bandwidth. Wide is for 25/30 khz channels. Doesn't seem to do much for the receiver; on other radios I have, swtiching from wide to narrow produces a change in volume for the same modulation. On the KG, setting the tx to wide will produce +/- 5khz transmit modulation. On Narrow, it's clamped to +/- 2.5 Khz.

I was wondering the same thing.

Maybe a better way to ask the question. What is Wouxuns definition of narrow and wide deviation? Is narrow 2.5Khz and wide 5Khz deviation? Or is wide 5Khz+?

Kirk

Narrow is 2.5khz deviation and wide is 5khz deviation. I just checked my kg-uvd1p with a service monitor and the receiver does not change to narrow when you program a channel to narrow. The transmitter does switch to 2.5khz dev.in narrow but the receiver stays wide.

I have the USB to serial cable. I hope you have the cable driver software installed (if you have this cable). I boot my computer with the cable inserted into the computer, but not the radio. I start the software and then I plug the cable into the radio with the radio on. This is the only routine that works for me. Any other proceedure and it will fail to connect for me. I never touch the port settings. I checked them after it connects and none of the ports are selected.

Richard

Hello,
it is mandatory to install driver for each usb port you are using with the interface, so all will work after.

Thank You... I did install the driver for the usb device. com 1 is already used. The program always shows all com ports gray AFTER the port the device is assigned to. My method of selecting a device is to select the available port and then save the .tw file. Next I open the device manager and set the poet to the selected number in the saved .tw file. I see no other way to do this. It still will not communicate with the radio. What am I missing?

SUCCESS!
OK... I did get it to work. For me it is a sequence issue.
Here are the steps I went through:
Application Setup:
1. Install USB Driver
2. Determine port assignment from system hardware manager
3. Install UVD1P application
4. Run app and select Communication Port number. Select
a different port if the port matching USB is not selectable (gray).
5. Save .tw file to PC (remember location)
6. If a port conflict exists return to system hardware manager
and use the advanced button to change USB port to match
the port selected in the application, and save the change.
7. Exit application

Radio Connection Sequence (works for me)
1. Run UVD1P application
2. OPEN the .tw file saved in step 5 above. This will bring in the
correct port setting for interfacing the PC to the Radio.
3. turn on radio
4. plug the interface cable into radio
5. read radio contents

My thanks to all who replied... Jim

175. High/Low power solution

Yahoo group: Wouxun_Radios (2009 — 2010)

From: popbolter
Topic: 175 Message: 175

I found a solution for switching from high to low power on the the first generation units. I think it is a great idea for the P models too!

I duplicated all of my repeater entries. I programmed the first entry (odd channel) on low power. I programmed the second channel with the same repeater (even channel) on high power. I can switch from low to high without looking! Here is an example:

Ch1 Repeater A Low power Scan-yes
Ch2 Repeater A High power Scan-no
Ch3 Repeater B Low power Scan-yes
Ch4 Repeater B High power Scan-no

Hello,

I have a problem with the Wouxun Kg Uvd1 recently purchased from 409 shop.com. In 2 m band after 1-2 min TX and Rx transceiver is freezing. Keypad and keys works but I cannot receive and transmitted. In 400-470 MHz (PMR band) radio works very well.

I suspect some problems with software because sometimes when I try to change working mode, the transceiver reboot.

Can you help me?

It should be set to Wide.

Topic: 178 Message: 178

Group,

Can anyone tell me the sequence to program in for setting the radio to work in different regions. I read in some places that the KG-UVD1P came confined to transmit ham bands only and it advertises to transmit alot more than that. I ordered mine 3 days ago and if anyone has any info or tips i can use on it when it gets here would be great.

Thanks,
I purchased one of these recently, and it does need a bit of deviation adjustment, it does not come close to the audio quality on TX that I get from my modified (fixed) VX-170 or Icom IC-91AD on TX. I also get the " you sound like your in a bucket" comments on the audio at times. I talked to another ham a few days ago that has the same HT, and he sounded just fine, so maybe it can be adjusted out.

I also noticed mention of a mic mod, or the need for one, I am not sure, it does not translate that well.. do you speak German, and if so, what were they referring to in that regard?

I speak english. Mic Mod = open mic "hole" on the front of the unit. By open, I mean to make it a bit bigger. Taking care not to damage the mic.

Thanks OM, I was kind of wondering as in one of the pictures it looked like they had circled a SMD capacitor near the deviation adjustment, and thought that may have been what they were referring too.

187. KG-UVD1 Unlock software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-08-24 12:59:04 UTC
From: kaskaskiadean2007
Topic: 187 Message: 187

Group,

I no longer need help from my previous post asking for help on how to open and set my transmit bandwidth if the radio comes only transmitting in ham bands only. I now have the unlock software to set the radio to transmit where i want it to as long as its within the 136-174 and 400-480 frequencies. Its a small program and less the a 1/2 megabyte in size. Basically justs opens a window and you set the frequency transmit areas where you want and then write back to radio and thats it.

I now have the unlock software to set the radio to transmit where i want it to as long as its within the 136-174 and 400-480 frequencies. Its a small program and less the a 1/2 megabyte in size. Basically justs opens a window and you set the frequency transmit areas where you want and then write back to radio and thats it.
>
Hi kaskaskiadean, Would you please send me a copy the file by e-mail, so I can change the frequencies of my UVD1. Or an other option is to put the file in the folder 'files' in this group.
Thanks in advance, Hans

195. RE: [Wouxun_KG-UVD1] DTMF tones too short for repeaters

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-08-30 13:15:27 UTC
From: Theo Marinos
Topic: 153 Message: 195

Hi

I have owned KG-UVD1P my radio for a week now and am very happy with it.

At first I too was concerned by the short dtmf tones however after playing with irlp for the first time tonight, I have had 100% success connecting to two nodes and then disconnecting without any problems.

From: Wouxun_KG-UVD1@yahoogroups.com [mailto:Wouxun_KG-UVD1@yahoogroups.com]
On Behalf Of ivarpito
Sent: Wednesday, 12 August 2009 8:00 AM
To: Wouxun_KG-UVD1@yahoogroups.com
Subject: [Wouxun_KG-UVD1] DTMF tones too short for repeaters

Hi, we've tested the dtmf and the decoding at the repeater side is very unreliable (much less than with other radios). The experts there are saying the tones generated are very short (maybe within the norm for such tone lenght but too short for software decoders used in the repeater). Is there any trick to set the dtmf tones duration longer (e.g. 100-300mS)?? Pito

196. Problem with programming software - "FAILED CONNECTION"

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-08-31 01:07:04 UTC
From: darwin3032000
Topic: 196 Message: 196

I have downloaded KG-UVD1-V1.04.exe from the Wouxon site.
I'm using a serial cable (originally supplied by www.409shop.com which works with Puxing radios and should also work with the Wouxun KG-UVD1)
I am using Windows XP SP3 and have tried from 3 different computers.
THe radio is the 450-520MHz version if that makes any difference.

The only COMM port that seems to be available is COMM 2 ☐ the rest are greyed out.

After selecting "READ FROM RADIO" the radio displays the green LED for a moment, then seems to reset.
I then get the "FAILED CONNECTION" message.
There is nothing wrong with the serial port on the computer as I can program other types of radios such as Motorola (using their software of course. The cable is good and works with a Puxing 777 radio.

Wouxun seem to be ignoring my request for help and the radio supplier is of little use.

Any suggestions would be appreciated.

- Daryl

Would you be kind enough to tell me what you did to get it working? It won't work on our repeater. Either that or it's not putting out the power Wouxun says it does.

Thanks!

Cliff

Sure, I got it connecting to an Australian node in Port Pirie, South Australia, and an English node, but can't remember which one. Both connections were via the VK5RSB 70cm repeater in Summertown, South Australia which is one of our many local repeaters.

Switches the bandwidth (most likely just TX deviation) from 5kHz to 2.5kHz.

2m repeaters in the UK are gradually switching to narrow deviation.

Mine's set for wide, but the tones are far, far, far too short. There's
no chance they'll work.

Ok, I have to admit it. I'm new to 2-way radios. I'm going to probably ask some dumb or simple questions to some of you so I ask in advance to please be kind. :o)

How are you getting it to recognize at 6 attempts? What are you doing exactly to get it to recognize?

If there is someone who is willing to take on a "newbie" and try to help me get my radio configured correctly, on the side, please let me know and I can contact you directly via email.

Thanks,
Cliff

I was under the impression that 2m IS narrow, ALWAYS. FM broadcast radio being wide. Unless one can change the tones WITHOUT changing the bandwidth, which I somehow doubt. Some repeaters are not as good audio-wise as they should be I feel. This is proven by listening to the input as well as the output. I HAVE opened the local repeater up with my Wouxun (New KG-UVD1P version) but the aerial is not good enough to give good reports. I intend to test mine more thoroughly when I get an SMA-BNC adapter onto it and use my home aerial. Audio reports so far are excellent both ways. Jeff.

Subject: Re: [Wouxun_KG-UVD1] Re: Bandwidth question

Switches the bandwidth (most likely just TX deviation) from 5kHz to 2.5kHz.

2m repeaters in the UK are gradually switching to narrow deviation.

I forgot to mention that I was referring to UK repeaters being narrowband. I see now that the question appears to relate to USA repeaters with which I am unfamiliar. My apologies. Jeff.

Maybe someone in here can help me, I just got my KG-UVD1P today and it came with the programing cable when I hook everything up my computer assigns it com 5 in the programming software only com 6 is an option. I try it and get failed connection, I go through the device manager and change the com port to port 6. still nothing the com port option in the programmer has com 6 grayed out but it is still selected. and now com 7 is selectable.

Any ideas??

Thanks,

Mark

I made an earlier post on the same subject. I have XP SP3 and it worked for me. I used the advanced tab in the com port device manager to set the port number to that selectable in the software. When I rebooted it matched ok and the data transfer worked from then onwards.

I just looked at my resulting config though. Prolific adapter is set on COM 5 in device manager. Transfer software has COM 1 selected but greyed out and COM 5 and 6 are selectable - BUT transfer works ok so I 'm not touching it! Weird.

Just received my KG-UVD1P and continue to get a "Failed Connection" when attempting to use the programing software. I have tried the possible solutions in earlier posts but to no avail. When initially installed the default setting for the software was Port 1 which was grayed out. I used the device manager to change the computer to port 1. This did not work so I tried ports from port 2 through port 7. Each time I got "Failed Connection". Does anyone have any suggestions? Thanks

If you want to build one look up for a standard "Kenwood" HT setup at any of the known ham sites. The two jacks are different size, one is Tx the other is RX. a few junkbox components are needed.

Any one experienced similar problem ?

When using repeater, I can adjust the squelch and filter weak signals

But when in simplex, even when turn off squelch (Sq = 0), see a full bar of signal, cannot hear any audio ? (I put it side by side with vx-2r, and vx-2r signal about s5 with audio) I adjust SQ from 0 to 9, and same, no audio....

Any idea on adjustment ?

Many thanks in advance !

hello,

JUST CHECK SUB-MENU NO-15 "R-CTC" AND SET THE TONE VALUE SETTING TO "OFF" IF DIFFERENT DATA IS SHOWN.

IF IT IS "OFF".... THAN SOME COMPONENTS INVOLVED IN AUDIO AMPLIFIER CIRCUIT OR SPEAKER IS DAMAGED . HOPE THAT THIS WILL WORK FOR YOU.

Mine behaves properly; when I turn the squelch to 0, squelch opens and I get noise. How about the squelch mode? Are you trying this in CSQ or DPL/TSQ modes? I think the squelch won't open even at 0 if a proper tone or code isn't received. Try setting your simplex channel to CSQ and test.

Which version radio do you have KG-UVD1 or the KG-UVD1P?
The KG-UVD1 has some strange "quirks" that produce strange results, the quirks where discovered by users as they tried to make the UDV1 work as normal and standard radios do. Wouxun NEVER acknowledged any of the "quirks" they just produced newer variants of the programming software to "cure" the blatant errors (turning on-off the voice English /Chinese, TX freq rolling to a .85 and not 00 and the TDR problem).
They quickly produced the NEW KG-UVD1P supposedly to bring DTMF encode to users but in my testing unit all of the known "quirks" D1 have been addressed leaving the original D1 users out to dry.
I will test my D1 and D1P for the problem this evening.
Best regards.

My "P" model works correctly. I tried it on a few different carrier squelch channels and the squelch opens on all of them when it's set to "0". On tone coded squelch channels it doesn't open as expected.

Many thanks for all the comments, suggestions, and feedback.

I re-test my "P" model based on feedback, and here are the findings:

If I set Tone Receive to Off, and Squelch to "o", then all is ok as I can hear audio, and I can increase Squelch from 1-9 to filter noise;

But if I set Tone receive to our local RACES CTCSS, and Squelch to "0", then even when my RX bar is full, no audio !! (next to my vx-2r with Tone CTCSS on, squelch on default, RX half bar, audio is ok)

Any suggestions, observations, and recommendations are welcome !!

Best,

Sounds like things are working as they should. Without a ctcss signal the squelch is not "tripped" although the signal strength without squelch is shown on the meter. Don't see a problem with the unit.

One thing that occurs to me...
If you are setting the receive tones using the programming software, then all should work. I would suggest triple-checking your settings, confirm with a service monitor that the KG's squelch opens on tone receive, etc.

However, if you are setting up the tones using the radio front panel, and saving in channel mode, it has a quirk you need to remember. Whenever you save a new channel to a blank location, it does not save the tone for receive on the first pass. Only the TX info is saved. That will be ok for simplex, or open repeaters, and a fixed offset. But to save a rx frequency with non-standard offset, squelch setting, or tone freq/code, then you have to make another pass. That is, re-enter the receive values, and save to a memory location that already has the tx information saved. Otherwise the tone and squelch info doesn't get saved. This is an odd thing, and I've never seen another radio behave that way.

Unless you are in VFO mode, in which case the above doesn't apply, and isn't helpful.

Good Luck

225. Short DTMF Tones....revisited.

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-09-13 13:59:23 UTC
From: k4gek
Topic: 225 Message: 225

Did anyone find any solutions to the DTMF tones being too short. We have two repeaters in NC, one where you can press 8 and get a signal report, the other is an EchoLink repeater. The repeater that has the DTMF signal report can pick up the tone and works properly, the EchoLink repeater can pick up the tones and I have been having to use my cell phone to key the node numbers over the speaker mic. Has anyone found a solution to making the DTMF tones longer or have talked to Wouxun about this?

73,

Kevin
K4GEK

226. Re: [Wouxun_KG-UVD1] Short DTMF Tones....revisited.

Yahoo group: Wouxun_Radios (2009 — 2010)

From: Gordon 'Yeti'
Topic: 225 Message: 226

I've emailed Wouxun and got the response that they've made them longer now.

I replied "fat lot of use that is, this is the second one I've bought"
and got no reply.

Either my one gets longer tones or it'll be the last Wouxun I ever buy.

228. Re: Squelch problem - Strong signal but no audio

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-09-16 04:10:44 UTC
From: acadinc
Topic: 213 Message: 228

Ron:

Many thanks for the recommendation!

I re-program using the software instead of the keypad, and then repeat the same test in simplex.

1) R-CTCSS is Off, Squelch is "0", and I can hear audio from club member tx with CTCSS.

2) R-CTCSS to same tx CTCSS, Squelch to "0", rx full bar but no audio (vx-2r same setting, half bar signal, good audio)

3) I then asked club member to increase his tx output from 5W to 50W, and now I can hear audio !? Reduce power down to 5W, no audio again (vx-2r has audio at both 5W and 50W)

Club member thinks squelch rejection ratio is somehow increased when R-CTCSS is on as audio is ok in 1) with 5W ...???

Any suggestions ??

Best,

I had the same problem with my KG-UVD1. After setting the port to com4, the program works fine, though XP shows a "resource conflict" massage.

Ooo, my favorite kind of massage!

Sorry, couldn't resist.

Funny thing happened on the way to programming my KG...
I installed the USB driver in a brand new Dell mini-10, running XP SP3, and then the programming software. Without doing anything, I hooked up a radio and tried to read it. As I sat there waiting, I realized I had forgotten to set the device manager, which I assumed was why the software seemed 'hung'. Then, just as I was readying the 3 finger salute, the bar started across the bottom and the radio was successfully read.

I opened device manager, saw the dongle was assigned COM5. Checked the software, and found it set to COM1. Didn't understand, so tried another read; same result, only this time no 'hang' time.

I have 'streets and trips' with the GPS dongle, with a serial to usb adapter made by the same folks. It behaves similarly; the program 'hunts' for the dongle on all the available com ports.

Could this dongle be doing something similar? Is the driver maybe hanging up on other serial ports when it finds something else plugged in? I manually set up another XP computer before checking this theory out. I've never gotten the software to work on my Vista machine.

Just wondering....

From: DanT
Topic: 231 Message: 231

My new KG-UVD1P just arrived and I successfully loaded frequencies via the software. What I don't understand is the purpose of the "A" Frequency Mode and "B" Frequency Mode columns on the "usable Function" page of the software. Since I set-up all my frequencies on the "channel message" page, I don't get the use for these columns. Are these default settings for "Frequency Mode (VFO)?"

232. RE: [Wouxun_KG-UVD1] Programming Software Question

I believe those to be the default frequencies when in the frequency, as opposed to channel, mode.

From: christophe.leclet
Topic: 233 Message: 233

Hi all,

I would like some detail about how realy work the Dual standby, I explain :
I want to listen 2 different frequencies and answer one or the over

I understood that in dual mode there is a master(default emision channel) and a vice channel.
--> question 1: by pressing A/B buton It switch master/Vice?

Thank you for your answer,

234. Re: Dual standby

Yahoo group: Wouxun_Radios (2009 — 2010)

Topic: 233 Message: 234

I've only had this radio for two days, but I think I can answer your question. Although this radio receives two channels simultaneously, only one can be listened to at a time. Transmission and audible reception is only on the active or "master" channel. Reception on the inactive ("vice") channel is indicated by movement of the associated "S" meter. The A/B switch cycles between the active ("master") and inactive ("vice") channel. I hope this answers your question.

I think I was in error in my earlier reply to your question. It appears that while you can transmit only on the "Master (active)" frequency, you can receive on either, but only one at a time. In other words, if a signal appears on "A" channel you can listen to it as long as you are not already listening to something on "B" . If a signal appears on the "B" channel, you can listen to it as long as you're not already listening to something on "A." I don't know what happens if both "A" and "B" are active at the same time, but I'd guess you would hear the one that became active first. In either case, you can only transmit on the "Master" channel and would use the "A/B" button to select that.

Hope I've got it right this time.

Thank you for your answer, it's enough to listen one at the time because anyway understand 2 converstion at the same time is kind of difficult.

Thanks again

Anyone read the specs on the new dual band KG-816? I'm sure glad that we now have a "stun" option along with "kill"!

Here I give you some outstanding functions of these new models.

a). DTMF Encoding / Decoding

b). 1750Hz Burst Tone

c). Distant Alarm & SOS Function

d). CTCSS/DCS Scan Function

e). Bright Flashlight Illumination

f). Inspection, Monitor, Stun and Kill function

g). Digital FM Radio Function

Sascha,
I have been looking for Months for ANY type of KG-UVD1 service manual never mind one for the latest version (long DTMF tones)with NO luck.
Got a email from a SP ham that was working in China last year and he claims that has one for the UVD1 but it is on a CD in Chinese.

I was away from the group and noticed that all of the "official" operating manuals are no longer posted on this groups file section and that Wouxum is no longer posting them,not even the old programing software, What is going on?

Well I guess that answers it!
Another DEAD product from the marketing geniuses at Wouxum.

Looks like Wouxun is making unbelievable strides in the China radio industry by providing misleading product functionality claims (I guess to attract "sucker" customers) producing a un-upgradeable product with no product repair or support and then providing the cold shoulder strategy to its customers hoping that they will go away quietly, now this is the way to make friends worldwide, guess we will be seeing re-education for some?.

Looks like PUXING is and will be the preferred radios that we will be using and recommending to the club members, I hope that they manufacture a dual band model soon.

I am so happy that the clubs members purchase only a small amount the KG-UVD1, 1P units since even with the factory DTMF they are useless for any functions that require DTMF tone functionality (IRLP.

Like you said "Won't be buying another".

My mistake- the new KG-816 is single band. Never mind!

245. Code for recive only channels

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-10-30 22:28:00 UTC
From: Leigha the Ballerina
Topic: 245 Message: 245

On the PUX 888's you enter the freq code of 67.000 as the transmit freq on the channel you want to recive only is that a code that has the same result on the Wouxun or some way to set recive only channels.

Thanks
Dave

I've had ths free software and $13-15 programing cable from the get go and programing is a breeze. I am told that closely following the manual's programing direction for channel(not vfo) programing is fairly easy...sorry but have never done it. Joe, maybe others on the group can assist.

Compared to other radios such as Icom, Yaesu, Kenwood, etc. the thing that initially confused me was some of the terminology. Where I typically thought in terms of "VFO Mode" or "Memory Mode" the Wouxun refers to these as the "Working Mode" (See Page 28.)

The second thing that was unusual for me was the terms "co-channel" and "dis-channel". Co-channel is the receive frequency and dis-channel is the transmit frequency when you are programming a memory channel.

The directions for programming a repeater pair (or any memory channel) are on Page 34 of the manual. Be sure to program in the transmit power and any PL tones *before* you store the frequencies to memory using the procedure on Page 34.

Note: When programming a repeater pair you do not program in the amount of frequency offset. You have to program in the actual receive and transmit frequencies as described on Page 34.

If you need to program memories manually I think the easiest way to do it is to write out a script on a piece of paper with each button that must be pressed including the frequencies. Then step through pressing the buttons.

Once you have programmed in a few memory channels it will get easier. Once you have programmed in a few more you'll realize that getting a cable and the programming software is well worth the few bucks that the cable costs. :-)

Hi everyone -

Looking through some of the posts about the DTMF code length etc., I have to ask - has anyone done a dump of the memory in the UVD1P? I'd like to have on because I want to edit the "UVD1P" screen to read my call but I don't have the software to do a dump anymore, could have done it 5 years ago but not now. So some of you computer specialist, can you do a dump and zip it up for people who want it. Since we all have the code and memory to read/write the bandwidth of a radio, we should be able to figure out how to change this. Then we can see if we can change the DTMF length, change the message out, maybe even change some other items to customize it. Any takers?

I think that Wouxum is making it hard for a "dump" since they have closed up all of the normal entry points this was done on the "P"
I was told that they do not want to give anyone the ability since they do not want "Flash" returns they just want to sell more new versions.
If you look at the web site thy are no longer carrying the D1 software only the only the "P" software.
All of the older sources of inside information have vaporized, wouxoun has stated that only the "factory" will have any "lab" software....

Care to share your "mod" I belive that the spv c500 was a HTC cell phone that was used by Orange in the UK and Cingular in the states.
A bit of tricky kit to do in my opinion, since the tone generating was done by the cell MB.

Hey mark. I'm having the same problem. The radio works fine on it's own, but it just won't connect via the USB lead.

I am running vista, i've downloaded the latest vista USB driver from the Wouxon site, along with the programming software.

All has installed correctly and appears to work.

When i plug the USB into the comp, it searches for the software and tells me it's all correct and working. When i open the radio software it loads fine, and lets me open and save new files etc. But if I do anything to try and get it to connect, it tells me the connection has failed.

For information, the USB lead is showing that it's using port 10. But on the software, all ports are greyed out and i can't select any.

Any suggestions from anyone would be welcomed.

Thanks

260. 1750hz Tone Burst

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-11-07 14:07:40 UTC
From: gareth1125@btinternet.com
Topic: 260 Message: 260

Just another quick one, but does anyone know how to get the tone burst to work?

My instructions tell me to press key "PF1"... but the instructions also fail to mention where "PF1" is. Is it the same as the side keys 1 and 2 ?

And if it is, I still can't get them to work as a tone burst. I can have "scan", "lamp", "SOS" or "radio" tho.

I'm sure it's in there somewhere... maybe i'm just having a moment? lol. but without I can't access my local repeater.

Thanks in advance.

Dave, go to the Wouxun site, click download and find the KG-UVD1 software. Here is the site http://www.wouxun.com/DownView.asp?ID=2&SortID=4 Good luck

Subject: [Wouxun_KG-UVD1] Software

I thought I downloaded the software from the wouxon site but only got the PDF of the manual.
Can anyone point me to the right site/page for the download of the software?
ThanksDaveWB1EVP

Hey mark. I'm having the same problem. The radio works fine on it's own, but it just won't connect via the USB lead.

I am running vista, i've downloaded the latest vista USB driver from the Wouxon site, along with the programming software.

All has installed correctly and appears to work.

When i plug the USB into the comp, it searches for the software and tells me it's all correct and working. When i open the radio software it loads fine, and lets me open and save new files etc. But if I do anything to try and get it to connect, it tells me the connection has failed.

For information, the USB lead is showing that it's using port 10. But on the software, all ports are greyed out and i can't select any.

Any suggestions from anyone would be welcomed.

Thanks

Subject: [Wouxun_KG-UVD1] 1750hz Tone Burst

Just another quick one, but does anyone know how to get the tone burst to
work?

My instructions tell me to press key "PF1"... but the instructions
also fail to mention where "PF1" is. Is it the same as the side keys 1 and 2
?

And if it is, I still can't get them to work as a tone burst. I can
have "scan", "lamp", "SOS" or "radio" tho.

I'm sure it's in there
somewhere... maybe i'm just having a moment? lol. but without I can't access my
local repeater.

Thanks in advance.

Maybe someone can help.
I am using the Kenwood/Puxing serial cable in com1 (both always work)
When I send or receive radio date the radio restarts once or twice and I get the "failed connection"
I have never had a successful connection with this radio using all the comm port tips listed in the many threads on this board.
Anyone have any ideas???
Should I buy the USB cable and try that???
Also what does the radio screen say when date is being passed???

'73 Michael

If it were me I'd buy the USB cable since that is the one Wouxun uses. Then I'd load their USB drivers from their web site. Once I had that in place I'd try again. I'm not sure that the Kenwood, Puxing SERIAL cable is guaranteed to work on a Wouxun.

I have tried the antenna a few months back and found it to be a poor match for both the kg-uvd as well as the vx-7r. High swr and worse on receive than the stock antenna, both 144 and 440. This is pretty typical results from these similar stubby antennas.

All of the antennas I tested performed poorly. I went with the Nagoya NA-666 because the antenna is extremely flexible. It makes storage of the radio much easier.

Thanks for the replies.
I thought that might be the case.

Just on another matter.
I havent been able to get this to trip our work repeater yet.
I have setup the offset & CTCSS with a data cable the same as in other working radios. I have tried the CTCSS frequency scan, (menue 30) without sucess.
I also have a Quansheng TG-UV & had to use this search function to get it to lock on the first time.

Most likely you have set a CTSS on the receive frequency when the repeater is NOT transmitting with one. I did that too the first time I tried programing with the software. You only need to set CTSS on transmit and not on receive unless you know for a fact that the repeater is sending with a CTSS tone.

276. Re: Programming KG UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-11-11 20:10:35 UTC
From: John
Topic: 246 Message: 276

Via software it is very easy. Just start the KG-UVD1P software, open a new TW1 file. Then in the blank form put in RX/TX (and these can even be cross band ie 147.610 TX 442.550 RX if you want), the appropriate CTSS signals (usually only TX or Cod as Wouxun calls it), power hi or low, wide band width on VHF narrow on UHF, busy lock yes or no, name the channel. Now you must put the cable into the radio and plug it into a USB port. Choose the port in the software and choose WRITE in the Program tab. You will see the bars move across the screen or you will see failed to connect, in which case you need to choose another com port. Once you have programmed the radio, go to menu 21 push menu again, turn the adjustment knob until you see CHFFREQ or NAME or CHANNEL, then push menu again. Now you should be able to change the adjustment knob and get the save frequencies to display.

In software you have to go into each of the settings for a particular channel that you want to save, set the settings that you want to save for that channel (menu, settings select number, menu, change to the value, then menu, exit). Once you have all the settings made, to save it to a channel you menu, settings select #27, menu again, the channel number you want to save to (of 128 available), then menu and exit. That saves the receive options - remember NO CTSS in receive on most repeaters. Immediately after setting this, go into the T-CTSS and set the CTSS frequency and save it. Go back to Menu 27, hit menu, menu,exit. Now you should have the transmit CTSS set for the channel you saved.

The PROBLEM IS that everything you set in all the menus is active for the next channel you want to save unless you change it manually. So if you set something that isn't needed for the next memory channel (i.e. CTSS, DCS, bandwidth, etc.) It doesn't matter it was stored in the radio and if you save it in a memory channel, it's used for that channel.

All this is in the manual on the Wouxun site. Good luck.

Is there a way to get the programming software to sort the entries? It'd be nice to enter them randomly or add a new pair and then re-sort the list before programming.

Alternately, does anyone know the format of the data file so a sort utility might be written?

Thanks,

Tim

I bought 2 about that time. Both claiming to have DTMF encoding but dont know if it works or not. Only reference I have is on page 39.
Other thing I can't get to work is CTCDD/DCS Frequency Scan, page 38.

I checked my radio with a service monitor and found the deviation to be a little low. I adjusted it to the proper setting using that pot. In the real world nobody will notice a difference. Many people falsely believe that adjusting the deviation pot will compensate for low transmit audio. It will not! It is an audio limiter adjustment NOT a gain control. To answer your question. You should leave the adjustment alone. Most radios are set close enough from the factory. Unless you have the proper test equipment you will probably do more harm then good.

Tim -

I've tried opening a TW1 file with everything I have (hex code, DB database, Foxpro, and many others) it just doesn't make sense in any of them. I assume they put in in some code for the processor in the radio (I had assumed hex) but don't know. What I do is keep an excel file named TW1-XXXXX.xls (xxxx is the date so I know when it was modified last) and set up with the same headers as the real TW1. Then I sort it in any order I want, copy and paste into the TW1 file and load it in the radio, fast and easy. Works for me.

Tim -

I've tried opening a TW1 file with everything I have (hex code, DB database, Foxpro, and many others) it just doesn't make sense in any of them. I assume they put in in some code for the processor in the radio (I had assumed hex) but don't know. What I do is keep an excel file named TW1-XXXXX.xls (xxxx is the date so I know when it was modified last) and set up with the same headers as the real TW1. Then I sort it in any order I want, copy and paste into the TW1 file and load it in the radio, fast and easy. Works for me.

I think I need more detailed instructions.

I tried creating a file in Excel with just a single entry for 146.520 simplex. When I past it into the 'Channel Message' screen the frequencies both end up being 146.000 instead of the 146.520 I began with. If I add a line that is 446.100 simplex it becomes 446.000 after the paste. If I select multiple rows and columns to copy when I past them only the first line is entered and anything after the decimal point for the frequency is chanhed to '.000'.

I'm sorry, I don't know what it could be. Yes you have to copy each cell into the TW1 file. In my case my first line is 146.610 and when I select the cell and select copy, switch to the TW1 and then select paste, it puts in 146.610. So i don't know what it could be but maybe something in how you have the cell defined.

My mistake. I thought you had meant you could paste all the cells at
once and not one at a time.

I've found the best way is not to mess around with COM port settings. Let the software find its own. (I'm using v1.04)

1. Plug the USB cable into the PC.
2. Plug the cable into the radio and turn on.
3. Start the software.
4. Download to the PC etc.

We've had problems with some USB programming cables. I have an earlier one which I purchased for Puxing radios. Works fine on Puxing and on a Wouxun KG-699E. The ones supplied with a batch of KG-UVD1P have not worked. These have now been replaced by the supplier and appear to be OK.

Good luck

Look in the radio software and find out which com port it is wanting to use. on my set up its com4

Go into device manager

find which com port the cable is on
right clip and select properites
clip on port setting
clip advance setting
from there set the com port to the chosen one for its 4

and then select ok

all done

Going into device manager my computer sees the Prolific usb on com port 4
I opened up the software and clikd communication port and the box shows on com5 in black, the rest are greay
do I open up the software first and see what port it wants to use and then got into computer and change it, or visa versa,
I have tried both

look like I am chasing my tail, this time I changed the comport in the computer and then went back into the software and it had changed
It said port 6, I went back into the compute and changed it to 6, back into the software and it shows com8 with a dot and com7 with no dot.
still no connection

Going into device manager my computer sees the Prolific usb on com port 4
I opened up the software and clikd communication port and the box shows on com5 in black, the rest are greay
do I open up the software first and see what port it wants to use and then got into computer and change it, or visa versa,
I have tried both

Look in the radio software and find out which com port it is wanting to use. on my set up its com4

Go into device manager

find which com port the cable is on
right clip and select properites

clip on port setting
clip advance setting
from there set the com port to the chosen one for its 4

and then select ok

all done

Hi Dave and the group, I had a local help me on the phone for close to an hour and no luck, we decided a cable problem, or radio problem

I saw this referenced in an ealier msg. I have a Kenwood cable for the TH-F6 and tried it and it works

From: Steve
Topic: 153 Message: 301

Wonderful,
Looks like WOUXUN STRIKES AGAIN.
Now we have a third variant of the infamous KG-UVD1-P (?) or what ever you want to call it.
The previous version only put out a DTMF tone burst and it was not working with many IRLP systems since the duration was to short and no settings available to extend.
GOOD LUCK with WOUXUN it sure looks like they react quickly to put out new models but wind up screwing every one who purchased their product.
The new MAX dual band radio has DTMF ENCODING AND DECODING, verified and working on IRLP and four of the local repeaters.
Went to a ham flea market today and found 3 KG-UVD1's (NO DTMF of any TYPE) for sale $30 each, every one that looked wanted to know if they had DTMF operating no takers.

From: ants_bradley
Topic: 302 Message: 302

Just got the radio, and have spent 6 hours trying to get the USB-serial cable driver installed (finally they seem ok), and now the dreaded 'connection failed' message.

It seems alot of others are also experiencing these problems with no clear solution. No matter how good the radio maybe, its pretty useless if you have to manually program all 128 channels using the keypad. what a dissapointment.

If anyone has any ideas to get over the connection failed error I would love to hear them, but I suspect the other threads have already exhausted them.

How many people actually did have a faulty cable, that was fixed with a new cable? Just wondering if there was a faulty batch or if thats just a guess at the problem.

You are supposed to be able to use the cable from the Puxing radio series.
Maybe someone near you has one of those, or even a serial port version.

Thank You,
Brian N2KGC

I just put a scope on the base of the 3.5mm plug, which I believe to be the Tx line (cable unplugged from radio), and there was def a signal there when I click 'read', so I can imagine it was sending the 'read' request thru to the radio, so appears to be doing somthing, but still not talking to each other when plugged together.

Got it to read!!!! :-)

After playing about with the in ear mic/earpiece thingy (which sounds so bad its pretty unuseable), I plugged the data cable back in and it flet a much better fit, did a read and worked.

So if yours isnt working try the above, or at least playing about with the cable till its a good solid fit and locked in.

309. the fix for the USB dongle, and the interface software.

Yahoo group: Wouxun_Radios (2009 — 2010)

From: circuitbrnr
Topic: 309 Message: 309

Since its a great little radio with a few blemishes, I offer the easy solution to getting yours set up with the PC.

The dongle driver isnt included in the kit nor is the interface software.
The interface software is on a chinese site that is hard to navigate.
Unless your into mandarin...
I hosted the files on my site, in english, and also link you to the dongle driver that is required to make the USB dongle actually work.
Yes, the USB cable is a network device in itself. The controller is mounted in the plug body.
Download and run this file 1st to install the USB controller driver for the Cable.
--- http://voxducer.com/Upload/DownFiles/2009.3.10_13.5.0_1754.zip

Unzip this package and run the setup.

Then run a good copy of the interface.
If you dont have the KG-UVD1P software, you can get a gopod copy here
--- http://www.motovoltage.com/KG-UVD1P.exe

With these two items in place, you chances of connecting to your wouxun is high.
Without them, chances are pretty low.

310. Need info on KG-UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)

Hi All,

Glad to find this groupp.

Has anyone purchased the 2m/220 version of this handheld?

I could use a newer 220 radio and for the price, this unit looks very attractive.

Any comments?

Thanks
Mike, KO9I

311. Re: PC connectivity is a joke

Yahoo group: Wouxun_Radios (2009 — 2010)

From: circuitbrnr
Topic: 302 Message: 311

Its not the cable guys, well yes it is,,, but its only because the Driver for the controller is AWOL.
Even if you have the driver for the dongle, connectivity can be flaky unless you exit the interface program, unplug the radio from the dongle, and start the sequence in order - Plug in the radio and dongle to USB socket, launch the inteface software, and after that, if you have the voxducer dongle driver installed in your OS, connects every time, no glitches.

http://voxducer.com/Upload/DownFiles/2009.3.10_13.5.0_1754.zip

this is the voxducer dongle driver everyone must have to use the supplied com cable. Unzip the package, and run setup.exe.
Doesnt require a reboot, so its pretty simple.
If it asks to reboot after installation (depends on OS) no biggie either.

Hope this helps anyone who cant use the dongle cable supplied by wouxun.

Hey, Wouxun, Send me another great radio (just one) for providing after-purchase support for your stuff!
How about a wouxun hat,jacket or T-shirt? lol

Topic: 312 Message: 312

And its only a theory, but it seems like it has some truth.
I think the radio is indeed a dual bander, but the firmware they rushed into production was short a few features.
At least they got their radio working and fit to market.
But annoying items involving DTMF and VFO I believe can be and will be fixed by improved firmware versions.
I was able to find a program to unlock the VFO ranges 400-480 mhz and 136-178 mhz on the US model.
This tells me a dongle-fed firmware upgrade would be very possible.
Perhaps wouxun will fix their firmware and unlock a few of the missing features.
Since this appears to be their flagship product right now, and its fairly new to market still, this could be a possibility.

I will sacrifice a goat and 3 chickens tonite and chant ancient bhuddist phrases to the chinese RF gods, and maybe we will get better firmware for the onboard micro-controller!!!

Oh one more tidbit -
The correct way to say wouxun in english is "Woo-shun" not "wooks-scun"
lol

Topic: 314 Message: 314

Hi all,
I found this video of a guy using using hist KG-UVD1P to receive the AM Air Band: http://bit.ly/5Dbxa
I didn't know the KG-UVD1P could do AM? Can anyone confirm this (or is he receiving in FM)? Also if it really does AM, does anyone know how to put the radio in this mode?
Cheers,

/jmc

Interesting theory..... mind you its just a theory.
Now on to reality!
The correct way to say Wouxun is WOSHING like wishing for support. Ha or wishing we never got the radio.
You will be WOSHING for a flash but you will be waiting for a Long Long Time. Wouxun's idea of a firmware fix is to put out another verient of the radio, ask me how do I know this,simple I have 3 versions of the same model the first the KG-UVD1 arrived in my hands in March 09 no DTMF (Wouxun web site was indicating DTMF Encode /Decode and this in February/March 09) many firmware problems NO support or firmware fixes just two software updates.
Next they started to send out radios to shills that had DTMF encode and they called it the KG-UVD1P but this was DTMF in very short burst Still no form of firmware updates to the KG-UVD1 for ANY of the faults, wqell the KG-UVD1P got a whole bunch of negative press since it was not compatibel with IRLP and or most repeter control well thay had a solution a new varient of the 1P it will send DTMF for as long as you keep the pad active as well as the PTT. StillNO flash for even the short burst KG-UVD1P . GOOD LUCK WAITING.

I just finished my tests of the MAX UV radio, excelent (as spec) RX/TX same feature set as the UVD1 , actualy more... and $20-30 bucks less Oh and it has fully operational DTMF ENCODE and DECODE.
Flash firware update is right in the setup program.

My guess is, the VHF band has been extended to cover the air frequencies.
The frequency shown in the video was 132.1 which is the higher end of the air band.
I would emagine it would be getting a bit scratchy down the bottom end.
But I've been wrong before.

Below 136mhz keyboard only down to 100.000
as radio has no decimal point can not enter 099.999 mhz.

There is a lot about this function on AURFSCAN web fourm

Hmmm, thats odd, maybe mine is the newest version?
I just bought it, and only have had it a few days so far.
Direct from factory.
I agree that we probably wont get a firmware upgrade from the factory from the fine chinese folks at wouxun... But who knows, maybe something from the ham hacker community? lol
As far as DTMF, mine works perfectly, with no limit to tone duration.
You must have had similar Enthusiasm as I had at first for the radios, since you tried several versions after the UVD1 let you down.
I can say this, the latest version (It must be) I have has working DTMF, and repeater controls work on our club repeater just fine from the radio.
Good to see we have knowlegable and sharp critics out there to identify and ring the bell.
Im sure if I hadnt gotten a version that works good, I would be a cynic too.

One thing your account can be good for, warning others who might buy a used UVD1 or UVD1p, that they might get an early version thats not fully functional on some of these features.

321. Re: My theory about this radio

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-02 10:07:59 UTC
From: Stuart Rayner
Topic: 312 Message: 321

Firstly, let me apologise if this is heading OT. I have been following this thread with interest, but one thing that has got my attention is the mention in a previous post that the original UVD1 (not the P) has a considerable amount of firmware bugs.

Right now I dont use my radio with IRLP or Echolink, so the lack of DTMF has not been a problem. However, Im intrigued as to what other errors people have encountered - and wonder what I might be missing without realising it. The only two noticable bugs I have come across in the month I have owned the radio are that it once seemed to reboot itself, and that the voice announcement for channel 60 sometimes says channel 1! Not show stoppers in this case, but is there anything more serious lurking under the hood that I should know about?

Also, if I DO ever need DTMF, am I right in thinking that it is just an audio tone that is transmitted in the same way as voice? I have a DTMF generator app on my mobile phone, so could I use that by putting the phone speaker against the radio mike, holding PTT and playing the tones? If I buy an extension mike (Kenwood connector, I believe) that has DTMF keys, will that do the job?

Thanks for any advice, Stu M6BSH

Good questions, Stu. I have had the uvd1 as well as the "p" model and have never really experienced firmware issues....not that there may not be any...just that I have not witnessed them. Sounds like you have identified a couple with your current rig.
As to DTMF, yes; in the first dtmf model (since upgraded) the tones are very brief. Users experienced mixed reviews using this model for irlp and echolink....actually some even reported no problems with the brevity of the tones while others claimed they were unworkable. Your workaround for tone generation via mobile phone or extension mic is indeed correct and would work. Actually in my ancient days of 2 meter phone patch operations I built a tone generator from a used touch tone phone pad and speaker that I would hold to the mic to bring up and use the repeater's phone patch.
Look for other members to contribute their input to your question.

73,

Steve

What do you think about the performance of the MAX UV compared to the Wouxun? What about sensitivity?
Concerning the firmware, are firmware updates actually made available by the manufacturer?
Last question does the MAX UV have the scrambler? I couldn't find it on the feature list.
cheers,

/jmc

But if you have the PC software, enter the rx freq and the TX freq auto
populates,
then delete the tx freq (leave it blank)
then write back to the radio

that will work fine .

RX only - when you press the PTT you get an error tone to remind you #

Fully computer programable, very similar to thr KG-UVD1 in style and feel it would not suprise me if it was not writen by the same software house, has firmware update "button" which jumps to selection of file location, UNLIKE THE KG-UVD1 the MAX has full VFO and CHAN SWITCH.
Scan is faster, DTMF decode is excelent,I love the fact that I can set in a number set the radio to the rpt and have my friend "page" me.
The only "missing" function is no flash light led.....

Thanks, Steve. Do you use the kenwood programing cable? Where did you find the software? Also in the 409 web site write up they claim the rig has the famous "led flashlight". A real deal breaker...smile.

I will give this a go & many thanks for the tip.

there is only one minor problem that might happen if you hit reverse freq mode will the rig transmit on the receive only frequency if it is accidentally pressed?

330. Bargain Sale of "p" model

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-05 13:05:26 UTC
From: Steve
Topic: 330 Message: 330

Have decided to part with my KG-UVd1P. Already own the Yaesu VX-7R and Christmas is coming.....smile. This is the model with the short burst DTMF tones. Rig is like new (5 months old and no known bugs)and will ship in original box with all accessories included as new plus manual. Is computer programmed with AMSAT satellite frequencies (AO-51, AO-27, and space station)along with local repeaters, GMRS and MURS channels. First $85US takes it including domestic(US addresses) shipping. If interested contact me via off line email.

73, Steve

331. Service Manual For KG-UVD1 found on mods.dk

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-07 21:40:40 UTC
From: David
Topic: 331 Message: 331

For anyone interested here is the link for getting the service manual for the KG-UVD1.

http://www.mods.dk/manual.php?brand=_other

Then go down until you see Wouxun KG-UVD1 Service manual in the list.

I have tried to upload the manual myself to the files area several times without any sucess, so you will have to d/l from mods.dk

332. RE: [Wouxun_KG-UVD1] Service Manual For KG-UVD1 found on mods.dk

333. Keypad failure - KG-UVD1 and KG-UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-07 23:53:58 UTC
From: darwin3032000
Topic: 333 Message: 333

I've been experiencing keypad problems.

I recently returned a KG-UVD1P with failed keypad in the first week.
Now the older KG-UVD1 which I have is experiencing the same problem.
The keypad simply stops operating which effectively renders the radio useless - particularly if you had the keypad locked at the time - which I did.
I have a theory that it might be temperature related.
I'm not sure if it is a software problem or something as simple as an interconnecting cable between the main PCB and the keypad.
I have reviewed the service manual (shocking translation to english) and I'm about to investigate further. Yes - I've tried all the obvious including software resets etc.

Has anyone had similar experience - must be more than bad luck that I have had 2 identical failures.

- Daryl

334. Re: My theory about this radio

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-10 10:51:03 UTC
From: David
Topic: 312 Message: 334

After studying the service manual for the KG-UVD1 (Yes it is in bad Chinglish)It appears that the firmware is stored in the 64K ERAM (U811 an 24C64) well as user data (ie the 128 channels & various user function settings)

IC811 an EM78P568-44, this is a variant of the EM78P568 used in the cheap FRS transceivers which is an once only program device at the time of manufacture of the rig as opposed to the EM78P568-44 used in this rig which is only a 44 pin device which has all the functions of the EM78P568 but with support for DCS & driving a separate display driver IC & using an external ERAM as mentioned earlier.

Steve,

Where did you manage to find the firmware updates and software for programing the MAX-UV? I was not able to find a manufacture's website, but I did email one vendor (lowpriceradio.com) and they said "Ok, Yes it is computer programmable BUT not at this time... The software is not available for it yet." If the software can be tracked down, this sounds like a fantastic buy.

Thanks for the help,

Rob

336. Re: MAX-UV

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-16 21:44:31 UTC
From: Steve
Topic: 312 Message: 336

I was sent the software from the manufacturer software house (they tend to outsource the touch and feel stuff) in china, the additional firmware was set as a "test" to see which version of DTMF encode/decode was prefered in the west for "ham" operation.
The standard factory version is geared to "commercial" operations and sometimes has not worked with slow ham systems.
I am sure that in the next few weeks the final (GUI) version of the radio prog software will be put out on the web for all.
just remember many manufacturers only produce "technician" friendly versions since they are usualy the only ones that prog the radios, just think of some of the quirky Moto stuff, MoSlo anyone?. hi hi.

Topic: 312 Message: 337

Hi Steve,
Any chance you could post a copy of the software for the MAX even if it is a only a beta version with no GUI it is still interesting.
The MAX does indeed look interesting, the problem (except from the current lack of programming software) as far as I am concerned is that there seem to be many more accessories available for the wouxun (high capacity 1700mah battery packs, battery case for AA batteries...)

Also does the MAX has the scrambler (it current Wouxun firmware is lacking this function as well but it is available on the TYT)

Any comments on the sensitivity of the MAC compared to the Wouxun or the TYT?

Cheers,

/jmc

Hi,
Very interesting info, thanks for sharing! Provided we could dump the firmware from the newer UVD1P and find a way to flash, does anyone know if it actually is the same hardware than the first UVD1 version?
Cheers,

/jmc

While awaiting my order for the Max-uv I discovered, contrary to my original assumption, while it is dual band vhf uhf rig it is not software programmable for receiving on uhf and transmitting on vhf within the same programable channel. This makes it unusable for my intended purpose of a backup AMSAT radio. Radio just arrived. Opened the box to confirm all there (even includes an earphone ptt mic). Looks good and solid. See http://www.climbmax.com.cn/em9768.htm for details. If anyone is interested I will part with it for $80 including shipping within the US.
Merry Christmas
73, Steve

Topic: 341 Message: 341

Hi all and merry christmas!
I read here: http://bit.ly/4sqrgt that it seems to be possible to enable the 220MHz band on the UVD1P using the unlock software.
Can anyone confirm this?
Also some sellers on ebay seem to pretend that there is a scrambler on the UVD1P, is this true? I could not find any info about that on Wouxun's web site.
Thanks!

/jmc

Just change the 400 - 480 MHZ info to 216 - 280 MHZ and reload the KG-VD1 or P. If you don't like the new band, you can just change it back. There isn't much 222MHZ activity around here in Suffolk, Va. Also has WOUXUN increased the time on the DTMF on the P model yet ?

Merry Christmas from Virginia U.S.A.

You can't convert the rig to 220, at least that is my experience. Yes you can unlock it and set it to that range, and it will even show the 220 range on the display, and show you transmitting there, but the signal is actually going out on the 440 range when doing so.

I emailed Wouxon about it, they stated that you have to buy one that works in that range. I've yet to see one for sale, if you do see one, post the link here as I'd like to pick one up myself. I have not searched in a few months.

345. KG-UVD1P frequency frontier

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2009-12-25 21:42:52 UTC
From: circuitbrnr
Topic: 345 Message: 345

Heres the unlocked potential of this radio and its VFO.

(only for the technical aspect of determining the operating capabilities of the radio in question's VFO range)

Operating in this set of parameters is obviously illegal and not recommended.

If someone else can get more out of it, let me know (is my freq counter messed up?)

100 mhz-999 mhz_____ receive(continuous tuning_all frequencies) (and maybe higher outside of display range [wow])

119.7 mhz-213 mhz_____ transmit(VHF) /

400 mhz-506 mhz_____ transmit(UHF)

so it cant transmit above 213 mhz, until you hit 400.

since it transmits at 120 up, it makes an aviation capable radio too.

although this radio isnt rated for that duty , officially.

Any technicians setting these radios up, beware of trying more than this as you can lock the firmware on the VFO and wont be able to revert back.

I managed to pull it back from the brink, but Ive heard of them sticking and not accepting programming or updating or unlocking/re-locking.

(it can stick on the out of range freq scheme, and reject USB cable programming, if you go to far---strange.)

I thought I was going to have to re-order another radio before I saved it. beware.

The coolest part is if it works well enough in the AV band for testing in the air.

The radios reciever is super sensitive, better than many expensive handhelds Ive used.

I used the unlock software to increase the upper receive range to 860mhz so I can monitor my local fire department. Unfortunately, the programming software gives me an error when I try to upload an 800mhz frequency (error 118 out of range). Is the unlocked range only for VFO and not for memory? Also, I can keyboard program an 800mhz frequency into memory, but I'm not receiving anything. What, if anything, am I doing wrong?

Hi All,
No good for air band as the KG-UVD1 only receives FM not AM

Can you explain how you configure the radio and which software you use to have continuous receive 100 mhz - 999 mhz?

I guess it might be able to go a little bit lower than 100mhz since the radio can receive broadcat fm band (80-108mhz)

Isn't the airband FM?

> I thought I was going to have to re-order another radio before I saved

Do you have some details on how you did that, might be useful before attempting the mod...

Thanks again for the info you provided! Always interesting to try to get the most of these radios!

Cheers,

/jmc

Only problem I see here is that at least in U.S., Aircraft band is all AM modulated... No AM capability in these radios. So, this adds a certain WTF factor to your post. I do NOT suggest "on the air testing" on FM on this band, even if you had AM available. Jerry, N9EKM

Of course primary AV band usage is AM for propagation reasons.
Ive heard some of the helicopters at our airport using FM on this.
and as it catches a segment of that band, I mentioned it.

On the model you order for 220, its got a different board inside.
Im only showing the possible working ranges of the VFO and radio combined. Just cause the VFO shows 600 mhz doesnt mean it is actually transmitting there. It does recieve continuously, but transmits only within the ranges I showed.
But its to note that it functions solidly within these ranges.
Slight increase spurrious emmisions at the edges of band - of course.
I found stuff on 600 mhz(receive) I had no idea was there

I will tell you whats really funny, Listening in on the FRS band with a 5 element 450 beam. Its like the primordial beginnings of CB all over again. Except with FRS, many have no idea their signal gets out beyond their backyard. Ive struck up QSOs with people driving around in their cars mobile, and you could tell it was their 1st encounter with real free radio communications like we know it.
The beam (5 element larsen) allows contact with a cheap FRS radio across the city.
I had no idea the band had so much activity until I started pointing the beam and monitoring. Mostly its hilarious to hear all the hash going on. A warehouse or similar operates on a bunch of these public-band radios nearby, and Ive dropped in and messed with them on occasion.
Last week I was the IRS inspector trying to find them to issue arrest warrants to the warehouse manager and staff. She figured out pretty quick I was teasing. Would have made a funny recording.
Hey, an idea ... A site with funny FRS recordings. could promote FRS in general. sponsored by motorola!

Which unlock software did you use? at least 3 varients that I know of,and what specific "limits did you set. W@hat is the interesting 600 stuff?
Regards.
Steve

I'm not sure if your question was posed to me, but here's the answer. The problem may not be with the unlock software. I found an error I made in setting the limits. I'm using KG-UVD1unlock2.exe ver. 1.2b which seems to work fine (at least it enters the changes). I now have set my limits at 136/174 for both transmit and receive (2-meter) and 400/860 receive and 400/486 transmit (70-centimeter). For programming, I'm using KG-UVD1PV 1.05 version (0707). I can manually program an 800mhz frequency into the radio, download it with the software, and re-upload it with the software. But when I enter an 800mhz frequency directly into the software, it automatically changes it to a frequency in the 400mhz. range. More importantly, I'm not receiving anything on the 800mhz frequency I manually programmed, and it is an active local Fire Department frequency. If there are other unlock and programming programs out there can you recommend one?

Thanks,

Dan

"yes" (there is now a scrambler version) ? or "yes" (theyre faking it ?)

the latest software (28/12/09) doesnt seem to mention a scrambler ??

Hi circuitbrnr,
Could you give us some more info on the software you are using and how you configure your radio to achieve what you described?
Your help would be much appreciated by the members of the group who want to try to get the most out of their radios!
Thanks for sharing your experience!

/jmc

From: dummygroup
Topic: 361 Message: 361

Hi all,
Has anyone heard about these: http://www.climbmax.com.cn/em9749.htm
Seems to be dual band??
256 memories (more than wouxun or puxing radios), dtmf, the announced frequency range is rather interesting:

136~174MHz, 245~246MHz,
350~390MHz, 400~470MHz,
470~512MHz(TX1/RX1)

Not sure if it is one model able to operate on all these bands? On the picture the display show both vhf and uhf frequency...
Happy New Year!

Interesting. Believe the 256 is a little misleading in that it has 128 programable channels each with a tx and rx frequency hence the 256 claim. Actually no differenct than the Wouxun or puxing models. I believe it uses the same programing software as the Climbmax EM-9768 and with that software the program restrictions require tx and rx within set bounds. For example 1)136-175mhz 2)350-391 mhz 3)400-471 mhz 4)480-521. So long as tx and rx (programed separately) are within the ranges of the 4 bands your channel is OK. It prohibits you from crossing ranges such as RX on 145 and tx on 470. For anyone interested in using the rig for AMSAT work that feature is a deal breaker. However under the single channel VFO mode one can cross the ranges......not much help when one needs to change frequencies to account for dopler.
Interesting ad however would as it would imply the 9749 has passed some type of FCC compliance.
Anyone have further insight?

73,

Steve

i just got my kg-uvd1p in the mail today. i ordered mine with the program cable but it has a different plug on the end then i was thinking. i thought it would USB, but it has a trapezoidal plug, which is the EXACT same plug on the back of my laptop. i think it should have the plug that connects to the plug on the back of my laptop. anyone know what to do now?

SOUNDS LIKE YOU GOT THE SERIAL CONNECTOR.

IF YOU CANT GET A SERIAL TO USB CONVERTER YOU COULD TRY SERIAL TO SERIAL ADAPTER. IF IT CONNECTS TO YOUR LAPTOP SEE IF IT SEES THE CONECTION AND GO.

DENNIS K

KB3CNV

PS I HAVE THE SAME CABLE DON'T USE IT BUT DID TRY IT ON A DESKTOP, IT WORKED FINE CONNECTED TO THE SERIAL PORT. PROGRAMMED JUST FINE.

yes, it's the serial connector. however, my laptop has the exact same connector. they will not fit one another because they are both male (?). i need one of them to be the female end to fit together. i will look for a serial to USB adapter.

You should be able to go to Radio Shack and get a serial gender changer adapter that will allow you to mate those connectors.

Thank You,

From: A
Topic: 363 Message: 367

The connectors should plug together without an adapter if they are both serial connections. Since they do not fit together, the one on the PC is likely not a serial connector. Look for a label like "101010" or "Serial A" or "RS232".
Just a guess, but it is possibly an external monitor connector. For the real old style, it is a DB9 female. That means it is a "D" shape connector, with 9 pins (2 rows) and it has holes for pins to fit in to. The other type of connector it could likely be is a DB15 for an external monitor. That has 3 rows of holes for pins.
A standard PC serial port is a DB9 male. That's 9 pins, in 2 rows.

368. Tone Bust Problem ???

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-01-02 10:09:10 UTC
From: gareth1125@btinternet.com
Topic: 368 Message: 368

Can anyone tell me how to get the tone burst to work on this radio? I've tried reading the instruction (in broken English) and although it says that the radio can do it (1750mhz), it gives me no indication on how too.

I'm assuming the function is reserved for the side function buttons, but as yet I can only get the light and radio mode to work.

If it helps, i do also have the PC/USB lead and software.

Any suggestions would be great...

Gareth

PS: Just for info, i did email Wouxun back in November... I'm still waiting for an answer.

Yes. They are both the same sex. U can pick up an adapter on ebay for a few bucks, or re-order the USB one (Much easier to use I've found), although both will do the job once plugged in.

If it's any help, Wouxon did send me an update saying that they have new software on their site for this radio. Personally, i can't find any difference between that and the old one, but at least it's free... lol.

Good luck.

Gareth

Steve... the LED flashlight was the only reason I bought this radio !!! Well, that and the fact I like puzzle solving (as in trying to programme the radio - lol).

Thankfully the USB cable and PC did it all for me, but i'd have been stuck without.

Lets hope they fix these bugs tho, cause what does work on the radio, works really well i've found.

73's,

Gareth

371. Re: DTMF tones too short for repeaters

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-01-02 10:26:24 UTC
From: gareth1125@btinternet.com
Topic: 153 Message: 371

It is a pain that they can't be made longer tones. Where I am I have 3 connected repeaters, and the DTMF only works on two of them, and with the third it seems much too short.

I'm guessing that some repeaters are capable of receiving short tones, and understanding them. For what it's worth, the two that do work with this radio are both newer repeaters.

Now all i need to do is work out how to get this 1750 tone burst to work...

Gareth

--- In Wouxun_KG-UVD1@yahoogroups.com, "ivarpito" <ivarpito@...> wrote:
>
> Hi, we've tested the dtmf and the decoding at the repeater side is very unreliable (much less than with other radios). The experts there are saying the tones generated are very short (maybe within the norm for such tone lenght but too short for software decoders used in the repeater). Is there any trick to set the dtmf tones duration longer (e.g. 100-300mS)?? Pito

From: gareth1125@btinternet.com
Topic: 207 Message: 372

After a fair bit of trial and error, I've finally got it working...

For some reason, it'll only work on one of the USB ports on the computer, and even then, i have to shut the comp off. Pug it in, then boot up, and then all works well.

I'm guessing it's something to do with the driver for the USB lead rather than the programming software but who knows.

Obviously it's not the best way to programme your radio, but I have to say, that once it can find it, programming it is very simple. Even my girlfriend did it for me ;-)

From: gareth1125@btinternet.com
Topic: 261 Message: 373

This page on Wouxun's site has both the USB driver and the programming software.

As a tip, don't forget the USB driver (and install it first), or it'll never work.

Yours,

Gareth

Topic: 260 Message: 374

Thanks for your replies guys, however, i'm still having no joy.
Key 1 turns the radio on (display shows 76.000) and currently has white noise as nothing is programmed in.

Key 2 turns on the white LED light.

If I press the PTT in and then press either of these buttons, nothing happens. At all...

Does the standard function need to be changed to something different before it works as a tone burst?

Yours,

Gareth

Are you using the Voxducer driver with that supplied USB cable?
If its the version like mine, the cable contains a controller that uses a software driver, and without the windows driver loaded, eeet no worky. I think I hsd already uploaded or at least linked to it here long ago. In case you need this cable driver, check files section for "voxducer_cable"

Hi, I have the newest version of uvd1-p (the one with continues DTMF tones), I got it on the 278th december 2009 from 409shop.

On my radio, while you are pressing the PTT button, you press the "TOP, SIDE BUTTON" to transmit the 1740 tone.

Hope this helps
Jason

Hi,
The two files I can see in the files area are 1KG-xxx unlock.exe and 1KG-xxx unlock2.exe, are you using one of these?
Can you tell us exactly which frequencies you enter to get continuous receive 100mhz-999 mhz ? and get the max of the transmit freguencies as you described in your post.
Thanks for your help!

Hi All,

I am looking at buying a KG-UVD1P, which is the 2m/220 version.

Does anyone know if this particular unit can be modified to work 440 also, making it a tri-bander?

...or can the KG-UVD1, the 2m/440 model, be converted to work 220mhz?

Thanks
Mike, KO9I

Can be altered by using software. (1KG-xxx-unlock.exe)
I have a 136/440 model working 100-999mhz
Not receiving much outside 136-174/400-470 and don't know what the rx output is .

Subject: [Wouxun_KG-UVD1] 220/440 Mod?

Hi All,

I am looking at buying a KG-UVD1P, which is the 2m/220 version.

Does anyone know if this particular unit can be modified to work 440 also, making it a tri-bander?

...or can the KG-UVD1, the 2m/440 model, be converted to work 220mhz?

Thanks
Mike, KO9I

382. 500 mhz Rec on 480 radio - VCO tweak?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-01-09 18:37:59 UTC
From: wasabi_bob2020
Topic: 382 Message: 382

I just picked up a KG-UVD1 from a friend who decided he didn't need it. The radio is a 400-480 split radio. I need to listen to local FD / PD and need to be able to REC to 505 mhz.

I shifted the split to 430-510 using the unlock software. It transmit fine, but won't receive beyond 499 mhz. I believ the VCO just needs a small tweak.

Radio works great on ham bands which is why I primarily purchased it.

Is a service manual available, or can anyone suggest a fix?

Thanks

383. PSK 31 Digital Modes???

Does the KG uvd1p or any other model from Wouxun support the usage of any of the common Digtal modes found on some other handhelds and base stations? Id like to operate PSK31 or a similiar digital mode on this handheld. Any thoughts from anyone??

Yep... PSK31 and virtually all other digital modes work very well on the 2m band as well as HF. Has ANYONE rigged up their wouxun to function in ANY of the digital modes, either in HF or VHF??? Please advise.

I also have low modulation on a 420-520MHz 1P model but adjustmemnt of the pot seems to have minimal effect and certainly does not get it to be as good as the non P model I also own.

Is there any hope of having Wouxun look at the problem or are there any other users out there with the same problem?

I have both the KG-UVD1 and KG-UVD1P models in 420-520MHz configuration. The hack available on this site which supposedly allows for extended operation does not seem to work.

It allows me to extend the frequency range to say 410-520MHz so far as the display is concerned but I am vert doubtful that it actually enables the extended RX or TX. I have only been able to experiment with the two radios.

Has anyone had success with getting a 420-520MHz radion to receive down to 410MHz?

Thanks for responding.

I have only used the KGUV1-unlock.exe to reprogram upper and lower limits.
Perhaps there are other steps of which I am unaware.
Is there further documentation? Given the current fire risks and that I live in a rural area I am keen to be able to receive the RFS frequencies in the 410+MHz range.

No Doco abut this I learnt by trail and error and in fact seting up a few of the units to run on the RFS PRM system as used by my brigade.

There is some coverage on the subject on the AURFSCAN fourms.

As from my playing with the units dose what it name suggest unlock the radio to work in the band you submit.

But then you need to reprogram the radio to tell it how to use them. the function you need is under the usable function tab and the set your A and B freq mode

Hi all,
I may be slow, but I'm still not getting how to make this radio receive out of band. I've been able to change the range via the unlock software, but I can't get it to actually transmit or receive outside the factory settings. I read something about using the "Usable Function" tab, but I'm still not sure what to do. Would someone who has had success post a step by step process.

Thanks,

Dan

I tried changing my 400-480, to 430-510. Using unlocker software I was able to get it to transmit beyond 480, but it will not receive beyond 499.95.

My only goal is to get it to receive through 502.000

I've noticed that while scanning programmed channels that also use sub-audible tone (CTCSS), scanning will stop when a signal NOT having the required tone are also on channel. This is definitely not right. Scanning should not stop when a signal w/o tone or with the wrong tone are on channel.

394. How can you turn off display backlight?

Each time my UVD1 receives a frequency the front panel display's backlight comes on. Can this be turned off? Having the light on consumes extra battery power.

So, after using the unlocker, how do you "reprogram" / "reset" or do what is required to make the radio recognize the change? My radio was 400-480 and I changed it to 430-510. It can transmit beyond 500 mhz, but will only receive to 499.995.

I only need it to receive to 502.

How do we reset?

Hi,
If you look in the mail archive of the group you will find a post from circuitbrnr who seems to have done some extensive research of the limits of the KG-UVD1P. It seems he is able to get continuous reveive 100mhz - 999mhz.
According to his post it seems however one has to be careful as the firmware can lock.
But I agree with you it would be great if someone who has managed to get it working would post a step by step guide along with the software they are using!
Also any info on how to avoid possible firmware lock or recover from it would be much appreciated!
Thanks,

/jm

From: Steve
Topic: 397 Message: 397

For those using the Wouxun software please note that because of an error in the "print" portion of the program you will see that the column headings for "Cod" and "Dec" will be reversed in your hard copy print out. This reversal is present in v 1.13 and, as far as I can tell, earlier versions. In calling it to their attention they acknowledge the error and indicated they will change the software but in the interim confirmed the labeling on your screen for these two functions is correct. The error is just in the print command. Go figure.

73, Steve

Since it is a PLL circuit capable of wide ranges, the other circuitry in the radio (band-pass filters, etc.) does inhibit reception on various bands.
I am going to map these dead zones soon, and provide a chart for resonant frequency ranges.
The transmit ranges I previously provided are valid, but some of the receive freqencies between 100-999 mhz simply do not work without tuning the RF board (another experiment coming up).
This is the reason for the chart Im going to make.
Many slices up and down the range work, due to harmonics, but i want to mark the known areas that work in the radios stock (but unlocked) configuration.
If I can tune the board for 500, or 880 mhz (known holes) it might really be a desired mod for some people.
A service diagram, or even just a schematic of this board will be needed before I get into the re-tuning/ re-alignment experiment, does anyone have one yet?

Drill out the mic hole on the face of radio to 3 or 4 mm diameter, and dont penetrate deeper than 8 mm during drilling.
Make shure to get the shavings out.
also, if you can make the hole profile slightly conical (like a couter-sunk hole), it will gather quite a bit more sound.
this almost doubled my audio output on transmit.

Thanks for the advice but it must be more than this since the other unit I have (KG-UVD1) is fine. Also the bad one is similarly bad with an external speaker mic.

The Yaesu VX-1R that I have has an even smaller mic hole and works well.

Daryl

From: Mike Lynn
Topic: 387 Message: 402

I purchased a 420 520 Unit. I have used the unlock software to drop
down to 110 Mhz
and 410 Mhz

I have been reading the thread about not able to receive from 500 onwards.
I have done a scan from 500 (12.5k steps) onwards and have found it able
to receive ok
I have had hits on the following frequencies
500.4125
500.750
502.100
505.7125
505.850 tone
505.900 tone
507.250
509.750

Maybe it might be because the unit was originally 480 ????????

Mike

Good question, Bob. I am not aware of a domestic vendor to buy direct. There is a US vendor, "lowpriceradio" but generally your purchases there will be drop shipped from HK. He's asking $125 for the KG-UVD1P. Buying direct from the "409shop" is probably the quickest and cheapest ($104 including shipping). I've purchased from both and find them very professional. Just received a new KG-UVD1P (136-174 mhz and 420-520 mhz) and was received in 10 business days from payment. Best wishes

73

2 months of constant service, dropped, banged and scratched... Battery abused, and lots of stress on the antenna jack via my BNC connectors...
Verdict ?
One kick ass little radio so far!
Strongest 5 watt transmit Ive ever seen, and one of the best receivers on VHF or UHF.
Im so very happy with this little peice of chinese junk, I hate to call it junk!
Well, lets say its well away from the junk rating, its actually proving to be a really really nice radio.
I use it as a base station, as a mobile, and as a portable...
I beat my jingtong into submission within 8 weeks, but this Wouxun is kicking butt, serious butt!
I AM buying another soon.
THank you Wouxun for a great radio that really delivers.

The testing continues.... TNC fittment and evaluation coming in february!!
Stay Tuned...
Same bat time ... same bat channel !!!

If indeed you have a pl259 male coming from your antenna (as opposed to a bnc plug) you need a sma female to pl259 female. See the following item on eBay 390139204123. Most of my antennas now use bnc plugs.

Bob, you won't find them directly sold in the US, because they're not FCC type approved. They're only part 97 approved. They would need to have the transmit locked to the actual US bands and submitted. Doesn't mean they couldn't be, but no one to my knowledge has, and as a ham, you can operate it legally in the bands you're authorized to use.

Ok boys....

Ive just received a couple of brand new from HONG KONG KG UVD1P models. Exactly which PC software bundles do I use, and EXACTLY WHICH UNLOCK hack do I use???? Ive noticed there are a number of uploaded "UNLOCK" files in the files section of this forum. Which one is the "MOTHER OF THEM ALL". Im trying to unlock as many freqs as possible with the least amount of complications.

Other than PC software from the files section and the UNLOCK file, is there ANYTHING else that Im going to need to get this beast rolling?

Please advise

I have to say I've been pleasantly surprised too. The annoyances have been minor, build seems reasonably stout. 409shop was very timely in shipping. The programming s/w is very basic and bit touchy, but it's not something I use often. The one feature I'd like is to be able to set a channel to "skip" so that the scan doesn't look there. Specifically I have the NOAA freq's plugged in and they're always on. Ok, make that two. The other thing is that you should be able to have transmit "follow" last VFO that broke squelch (as an option). Both of these would seem to be micro controller tweaks. Not that the name brands aren't better, but you have to wonder if they're 3x better.

Just a thought. Through the software you can flag scan to skip a specific channel in the scanning process.

The first gen UVD1 had that - as standard, and you couldn't turn it off.

REALLY infuriating - especially in Amateur Radio (where CTCSS/DCS
generally aren't used).

<soapbox>

It seems like there's a lot of messages on this board about how to unlock or expand the xmit/recv band of these radios. I have to say this worries me a little. As shipped, these are capable of transmitting onto bands set aside for public safety and and those that do dangerous work like railyards. Currently, it's legal to own these as long as they're used in a legal manner. If fire and police start complaining enough, I could see that changing. The emcomm folks I talk to are starting to get feedback that it's getting noticed and these chinese radios seem to be the thing that they point to.

Want to listen? no problem, unless they bust you and think you were scanning the police or fire freq's to commit a crime. Then you're EXTRA special.

If you key the mic and live in the USA, you should have a license and an allocated band for any freq these cover. MURS being the exception if you use the low power and narrow settings. FRS - even the 1 watt setting is too high. I know, the reality that anything will happen to you (assuming you stay out of police/fire) is small, but character is what you do when nobody's watching. These things aren't toys (no matter what the exporter stamps on the box for customs). They're 5 watts, the signal carries quite a ways, and if enough of these start showing up on air where they don't belong, I could see rule changes that would make these very hard to get and illegal to own.

</soapbox>

Interesting pointe but very Country dependant.

Its not able to broadcast on either the police, fire, Ambulance or
railways freq in my area unless you have found away to make them
transmit in a digital mode that is.

As I said, USA. Many larger US agencies are also digital, but there is still a lot of legacy infrastructure in use. County fire and EMS is on VHF FM here. The Union Pacific railroad switch yard about 4 miles from my house is on VHF FM.

In any event, the point (apparently lost in translation) was that you should be careful and only transmit on the frequencies you're authorized so you don't interfere with others. Is that not true where you are located?

jim

Don't confuse frequency with modulation. You may VERY WELL be able to transmit on the same frequencies as your public safety agencies, but FM will not be heard, BUT you can still cause interference and possibly cost lives.

I just ordered a KGUVD1P from SolidRadio on eBay. Has anyone who ordered from them had to pay customs when it arrived? If so, how much might it be? What time frame should I expect for delivery ... if you have ordered from them in the past? If the radio turns out decent -- and should from everything everyone has posted here tells me -- I might go back and buy a one or a few more. It's a real bargain and a far cry from the price I am used to paying for commercial or amateur gear. 73, Chuck

I ordered a pair last Fall and the package took about 8 working days to arrive. There was no duty charged when it arrived.

Oddly when I later ordered some accessories they were shipped via regular mail instead of a package service and they took a little over three weeks to get here.

You seem to be from NSW, Australia if your profile is correct. Assuming it is, the ACMA rules are actually MUCH stricter than the US FCC. Simply being in possession of a device that's capable of broadcasting outside your CB bands without a license to be on that band is a crime. You don't even have to key the mic.

James,

I have the 150/450 version. I don't think there is any band switching as such -- I can program vhf or uhf on any of the
channels. I seldom use the dual-receive ("TDR") function.

To keep it simple for a simple guy like me, I just press the
TDR button until the display shows "UVD1" on the bottom line.
All the channels I have programmed, vhf and uhf, can be scanned on the
top line.

I've read some complaints about the radio that suggest that it
can unexpectedly switch you from A to B bank, leaving you
talking on a channel you didn't expect.

Hope this helps!

Bob,

All scanners that do PL/DPL scannig that I've used (including
Motorola commercial radios) pause when they hit a channel
with an rf carrier, but without the programmed PL/DPL code.

I think that's because of the two-step nature of the process:
First, the radio carrier squelch has to open, as on a regular channel, then the PL/DPL decoder has to read the incoming code to see if it matches.

Particularly since PL tones are relatively low-frequency, the
time spent to lock up a PLL decoder can be significant.

As long as I don't have to LISTEN to the "wrong-code" audio, I'm willing to put up with the time it takes for the radio to
reject it.

Hope this helps.

If everyone already figured this out, please excuse my mentioning it!

When you right-click on a channel number, you get a choice of three apparently-chinese edit choices. They work like regular windows edits, mostly. I'll refer to them here as TOP, MID and BOT.

TOP - Copies the info for this channel to scratchpad

MID - Pastes scratchpad info to selected channel

BOT - Cuts info for this channel to scratchpad. Info removed from old location, but only after pasting it

It looks to me as if you can only do single channels, not groups. Still, it's lots better than retyping all the parameters!

450. KG-UVD1P Series 13 Unlock blocked

Yahoo group: Wouxun_Radios (2009 — 2010)

Hallo,

i received this year my brandnew wouxun series 13. It cames from factory with frequency range from 136-174 and 420-520 MHZ. I checked
all versions of the unlock software. I can read from my wouxun and write too. But i can only change the range 136-174 to 120-174 that works great, but the other range from 420-520 is locked. It is possible to programm a range like 350-470 and the display on the wouxun shows these range but it doesn't transmit or receive on that range. What goes wrong. I there any dealer code to unlock or special software too. Need some help.

I have to wonder WHY people wish to expand these rigs any more than they are already. Surely they cover more than enough width and who can one listen to on more than two or three bands or so anyway? Do they have a licence to work these frequencies? Does their country permit free usage on them or what? I can not see it personally as most civilized countries have ground rules on spectrum use. Some questions asked on this group appear to come from individuals who give the distinct impression of having little knowledge on the subject and this worries me. I have visions of some individuals transmitting on bands they have no authority to do so and consequently causing potentially massive problems in the future, perhaps not to myself, but to others. I can only hope that that is not the case and that they only wish to listen to other frequencies. I have no problem with that if it is permitted in their country. Concerned citizen.

Sorry but i don't understand for what your posting good is?
It is no answer to my question.
A newsgroup is for helping each other not for people who
know everything better! If you had read my post correct you
see that i don't want to expand my rig. I only want to change the
frequency range from 420-520 to 350-470.
And know i wait for helping answers!

Hi,
There is a post from circuitbrnr in the archive that might explain what you describe:

http://groups.yahoo.com/group/Wouxun_KG-UVD1/message/399

Basically the rf circuitry might not be able to lock on the frequencies you see on the display. I think circuitbrnr is doing some research on it and would post more info to the list so that we can make the most of these little radios.
Cheers,

/jmc

Hello, I noticed that when in the freq. mode (vfo) and you program an offset, lets say you program a minus. (menu 24) That show up fine in the display. But when I program it into a memory channel (CHFREQ) it shows up in the display as + and - ???? anyone having this issue?

Virtually all of my programming experience has been via the software where it is a snap. Would guess that offset is necessary in freq mode as you are not really setting directly the second frequency....it being determined via the offset you set. Under channel mode you physically set the Rx and Tx frequencies hence an "offset" setting is meaningless(see menu 27)....just a thought. Would highly recommend you get the programing cable (10 bucks or so) and download the free programing software....will make things much easier for you.

Think I understand the question......All 3 sequential models of this rig I have had had this same display. All of mine have shown both + and - when in channel mode. Just checked my most recent model and with a Rx of 436.3100 and Tx of 145.920 I get both the + and - on the display. When mic is keyed the + and - remain the same while the rig transmits appropriately.

It's the same on mine. I suspect the "+ -" indication is meant to show duplex mode as opposed to simplex mode and not an indication of the direction programmed for that memory position.

Reverse is swapping the two repeater frequencies, so you will listen to the input frequency and transmit on the output of the repeater.

This is not a bug, it is normal as memory channels are programmed with a Transmit frequency and a Receive Frequency, therefore the OFFSET is redundant in memory mode.

hit menu, then scan through the menu options using the arrow keys until you reach "CH-MDF" and hit the menu button again. the arrow should drop to the line of text below. Cycle through the options until you see the word "name" or the letters "CH" and hit menu again. Hit exit and you should see your channel numbers or names and be able to cycle through the channels you programmed.

Hope this helps.

You will still need to switch from the "freq" setting to "channel" mode using menu/tdr. Soverignranger is referring to menu item #27.

I have made up a couple of UHF CB files, the current 40 channels and the new
60 channel allocation we are awaiting for approval.

Simon

How I get a hold of the UHF CB files?

Cheers
Theo

To enter this frequency you would need 2.5kHz steps which are not available.
The closest you will get is to go for 5kHz steps and this is why the
frequency you are entering is being rounded.

I don't think the Kenwood battery packs are compatible, but the microphones are. Besides, the Wouxun battery packs are very competitively priced compared to the name brands.

489. Re: [Wouxun_KG-UVD1] Re: Kenwood accessories for the KG-UVD1P

I believe it is only audio accessories that are compatible, so speaker mic, headphone etc.

I would also have to agree that the cost and life of the Wouxun batteries are very impressive.

Page 43 of KG-UVD1 -

WORKING with Repeater

This transeiver has two working modes while working with repeater.

(1) Frequency mode working with repater (2) Channel mode working with repeater

1. Frequency mode working with repeater

(1) Press A/B to choose band A, Set the Tx frequency and sub-tones which need to work with the repeater.

(2) Press A/B to choose band B, set the Rx frequency (it the repeater has TX sub-tones, you can also set sub-tonesin band B)

(3) Press MENUE + TDR , frequency mode working with repeater set. The TDR disappeared but the screen dipsplays "". And then press AB again, the setting is finished.

I CAN NOT GET THIS TO WORK - DID ANYBODY GET IT TO WORK AS WRITTEN IN THE MANUAL? CAN YOU TEACH ME HOW?

I have no problem using repeaters in channel mode.

Thanks,

ALAN, NY2G - NYC, NY

Got my new KG-UVD1P recently and did the hack to up and lower the band limits.

Although you can tell it to do from 25mhz to 999mhz theres no point as the radio cannot transmit or receive between the bands ive tested below.

Low Band VHF Receive 120 - 210
Low Band VHF Transmit 120 - 210

High Band UHF Receive 350 - 485
High Band UHF Transmit 350 - 485

the above beats the manufactured settings of 136-174 and 400-470

hope this information helps somebody like me that wanted to know everything possible with this radio!

Andy.

That's odd, some of the radios advertise frequencies in the 420-520 range. I just figured they each had different programming. If the hack won't allow what they are advertised to do maybe something is wrong with the hack. Are you saying they will tune to 520 and receive but won't transmit at that frequency using the hack?

Just curious, Ted (K2TJR)

Actually, Jim has a very valid concern. While I am sure the OP was careful and professional in his testing, it is important to remember that it only takes one jack-off to ruin things for the rest of us should he decide to goof around where he shouldn't be goofing.

Thats just the concern for our privileges, you also have to consider any inconvenience that might have been caused to HAMs, LE, or others who have paid their dues to be able to use radio frequencies without interruption.

I am grateful to the OP for the information BTW...

As ive said the radio i tested was one of the sorts that was just meant to be 400-470, if you hack it to go higher the radio doesnt actually transmit. i tested by using a realistic pro 2006 scanner and anything above 485 slowly drifted out of range and didnt key up, no audio or signal were coming from the radio. short transmissions were used mostly by the roger bleep emitted on de-keying.

i tested 10mhz a time from 25 to 520 and then again from where a scanners gap restarts around 760mhz.

other models of this radio MIGHT be able to go higher, maybe somebody with a 400 - 520 advertised model can confirm this?

remember just because the display says a frequency DOES NOT mean the unit is capable of getting that high or low. it all matters on the radio specs or even version numbers. i read here somewhere that v13 models dont even allow it to be hacked?

just to note you can of course hear the noise by pressing button 2 and hear the squelch noise but that means nothing.

with the expansion i have done im very happy with the result, i only wanted 350-470+ and 136-180 but i have got higher and lower than those figures.

Thankyou, and if anybody is considering buying one of these radios i suggest you do.

Andy.

you wont be able to listen to airband frequecies since the radio is FM and airband is AM, i did try to listen to london heathrow but it sounded of course off frequency.

to expand your radio to 120 simply download KG-xxx unlock.exe from the downloads section h ttp://f1.grp.yahoofs.com/v1/IJ98S-YCOE-sqtY0Q4-pdCnlEDXQy0EFsx0yxVUkUHueN3zmSuj7pjcGTTV_SL 96zS7Y_PWhDe3DVaBLK8HeaNXuTZ3XyjTvB7U/Software/KG-xxx%20unlock.zip

usb cable needs setting up properly too, hopefully youll be sent a cd with all the info otherwise it is in the downloads section too, all you have to do is make sure its set to com1.

You think you're talking an extreme case, but I regularly (and clearly) hit a 2 meter repeater that is over 40 miles away on 5 watts and the oem antenna. Most users of vhf/uhf use towers so they CAN get to the legitimate users. That means you don't have to, and keying up where you're not supposed to can have just as big an impact (of course you didn't think of that did you, Einstein). You know he was in the f'ing AIR BAND? Just because he's FM and the air band is AM doesn't mean he can't cause interference.

What I'm seeing is a lot of playing around by people who don't know or don't care about the effects they're having.

Nice job. Hopefully you'll take up firearms with the same care you give to radio and the effect will be self limiting.

jim

503. Slim Jim antenna

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-02-18 10:47:43 UTC
From: Matt Grice
Topic: 503 Message: 503

Hi all,

I recently made a slim Jim antenna for the KG-UVD1P out of 300 ohm twin feeder. It works like a charm, but isn't very portable. :)

Anyone else played with antennas for this great little rig?

Off topic side note - I use the frequency unlocker program to actually *limit* my KG-UVD1P to the legal bands. Glad it's out there.

Many thanks,

Matt de M6FNG

Hi Matt,

That is good to know that you can limit the bands to be legal.
Do you know if it is possible to limit the Tx&Rx only but and set the RX to cover other frequencies, I'm thinking the likes of Marine Band since I live near the coast and I wouldn't want to accidentally Tx there.

hi,

sorry to jump in here but yes you can do that,
if i were you download the unlock and you can see 4 boxes, each set of boxes has the band limits for tx & rx seperatly for that band uhf or vhf.

on vhf you could have 136-174 rx and say 150 - 160 tx.

Andy.

From: c5arnie
Topic: 511 Message: 511

I have 2 of these radios, programed identically.
Recently I noticed one of them down in volume compared with the other.
I put it on charge & that seemed to fix the problem.
It happened again today but was already on charge.
I have swapped over the batteries but it made no difference.
I have done a factory re-set & then reprogrammed it but it made no difference.
Looks like it may be dying.

I made a "Super J-Pole" from 1/2" copper pipe. I made it with male-female connectors to facilitate portability as I'm involved in disaster preparedness work. I used two male connectors and a PVC coupler to join the 2-meter and 70cm sections and an old photographic tripod to set it up in the field. It works quite well. I have a 1.1:1 match on 2-meters and 1.3:1 on 70cm. I use it frequently with my KG-UVD1P with good results.

If you are foolish enough to pick a random frequency to use as your own then
that is your problem when you are caught. I have absolutely no problem with
having you charged if I find you illegally using a frequency. If you want
to use a frequecy get licenced, whether that be Amateur Radio or Commercial.

I have no problem with people experimenting with thier radios, go for it!
But if you get caught transmitting out of band where you are not licenced to
then that is your problem when you get caught.

I am more than happy for people to experiment, if they get caught transmitting where they are not licenced I have absolutely NO sympathy for them either.

I would still encourage Andrew to get an Amateur Licence to allow you to experiment within certain bands, that is exactly what Amateur Radio is about. You don't necessarily have to rag chew with boring people, there are so many aspects to the hobby and you can choose what you want to do.

Hello.
Some times ago I see a similar problem.
I opened some KG-UVD1P to change the keyboards.
I checked them and the volume was ok.
I closed the radio the the volume was low.
I opened the radio again: it seems there are something around the speaker that was squeezed.
I do not know exactly what was. Open the radio and check it. May be the isolation rubber or the 2 wires
that go to the speaker.
It the opened radio does not have such a problem, then check if there is something squeezed.

Best Regards.
Francesco

I agree with Francesco. I took my radio apart and when I reassembled it the volume was low. When I disassembled it I found the insulator was not covering one of the speaker terminals. I move the insulator and it has been fine since.

Hi Francesco

Thanks for your reply.
I will check that out.
I hope that is the problem.
I did open that one up 2 months ago to enlarge the microphone hole.
It didn't seem to make any difference, so I left the other one alone.

Regards
Arnie

I just wanted to drop a line and say Thank you for forming this group.
After trying many times to program this lil rig manually and with the cable, this HT was just about to hit the chopping block. Thanks to this group, I was able to find and download the driver so my laptop can "see" the radio. If it wasn't so late, I would program it right now, but now I have something to look forward to after work tomorrow.

That was the problem alright.
I rearanged the sticky insulation to cover all of the wires & contacts.
Thanks for you help guys.

I have also made a "J-Pole" antenna for 145MHz from copper pipe, but right now is only mechanical part. I am waiting for connection cable, I ordered 25m of H1000, but KG-UVD1P has SMA male connection for antenna and H1000 is a big cable, so also I need a pigtail cable.
What kind of cable and connection do you use? And what are the dimensions of the "supper J-Pole"?

Hi

Try these two antenna's

http://www2.arrl.org/tis/info/pdf/0302038.pdf

http://www.qsl.net/pa0fbk/hampage_files/fbk2-70a.jpg

We found the coaxial collinear better for UHF.

We imported 30 sets KG-UVD1P, plus almost all accessories directly from
wouxun as a package deal.

We are now making the coaxial collinear for 10 of the users.

A lot of agencies are already going digital, or are wanting to and just need something like this to hold up as an example as to why it is necessary.

I agree 100% that frequencies pirates should be charged. However, here in my area (Oklahoma, USA) certain paid radio services like GMRS are almost exclusively inhabited by pirates, with two registered GMRS users and (as far as I've been able to count so far) 23 seperate pirate broadcast locations just in town. IMO it's only a matter of time before the GMRS license requirement is dropped.

As far as customs confiscating radio equipment. I'm surprised they don't do that now TBH. Everybody is already so paranoid about what comes into this country... Lucky for us I guess.

In Utah, most agencies have gone digital not because of these radios, but because a lot of crooks used scanners to keep track of what the agencies were doing. Open bands are akin to transferring data over the internet plain text, anyone can pick it up. I use this radio because I am a General class operator and work with Emergency Services, as well as our office has two frequencies. I hate having to carry 3 radios. As far as those who open up their radios, they might just be doing it because they use it for work, like to tinker .and/or listen in.I know that it happens that they will use it for other means, but if this radio weren't around, they would find another.All the rest of us can do is take due notice and govern ourselves accordingly.

I placed a link to the instructions in the links section. The dimensions are: 57-1/2" for the 2-meter section; 38" for the 70cm section; 19" for the feed section; 2" for the cross piece, and a piece about 3" long for a stub to mount the antenna. The 1/4" copper loop that connects the 2-meter and 70cm sections is 42" long, I modified the lengths to accommodate the male / female connectors I used to divide the 57-1/2" section in half for portability. Again, for portability I used copper electrical lugs to connect the small copper loop that connect the 2-meter and 70cm sections.For cable, I used RG-8x with a PL-259 to female SMA converter at the radio end. At the antenna end, I coiled five loops of the coax around a 1-1/2" PVC pipe piece to act as a balun.

532. Ham radio repeater setup of KG-UVD1P in FREQUENCY MODE.

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-02-19 21:11:21 UTC
From: alannyc1981x2
Topic: 532 Message: 532

OK I have no problem setting up Ham Radio repeater splits and CTSS
for each channel in Channel Mode. However, since I do a lot of traveling
I want to set up repeater frequency, splits and CTSS directly into
FREQUENCY MODE and see if I can work the local repeater. If I cannot I
pick another repeater and try that one. I do not want to use Channel
Mode except for repeater used near home.

```
How do I set up in FREQUENCY MODE repeater frequencies, splits, CTSS?

From: circuitbrnr@hotmail.com
Topic: 533 Message: 533

Theres a trojan in the 1.13 interface software executable.
Its been identified as 'Trojan-Clicker.Win32.VBiframe.bfi'
This is a preliminary Kaspersky labs identifier with no information about it yet.
Its new enough to be considered a zero-day threat.
No white papers or even IDs have been assigned yet.
This infection may or may not be manifested in all distributions of this file, but the warning is valid.
With the recent rash of new exploits, its no suprise to see artifacts of strange new trojans anywhere. The trojan is only the carrier, not the infection, and these days they more often then not carry a root-kit as its payload. (and you arent going to detect rootkits with AV software of any type)

I would suggest using the previous version, as they only thing I noticed different was the cut/paste/delete sub-menus were in english.
I can handle the chinese, minus the Trojan horse instead.

The question I would have to ask is where did you source of the software?

Personaly I only get it direct from the Wouxun website. I would not even
touch a version from this site and why would you when it is freely available
from the official website?

"alannyc1981x2" <YAMAHAXS650H@...m> пишет:

> How do I set up in FREQUENCY MODE repeater frequencies, splits,
> CTSS? [(:|]

1. Set frequency
2. Set tone: Menu -> 16 (CTCSS) or 18 (DCS) -> Menu -> select
repeater's tone -> Menu
3. Set repeater offset: Menu -> 23 -> Menu -> select absolute
value of offset -> Menu
4. Switch on offset: Menu -> 24 -> Menu -> select "+" for offset up
or "-" for offset down -> Menu

Done.

If I may offer my heretical view for a moment:

I partner with a number of jurisdictions, all of which have gone to trunking radios for the prime public service agencies.

Post Katrina and Haiti, a LARGE need has been identified for the ability to communicate for response, restoration, and recovery operations. Meaning - we are going to need more radios, frequencies, operators, and distance.

With regret, due to cost of radios, time to get trunked radios, time to set up new channels, time to train folks on the newer type systems, we don't see a reasonable way to surge on the trunk system post disaster.

Thankfully, we still have our equipment, repeaters, and the ability to leverage them 'quickly' to increase our communications capability for public service, recovery operations, governmental operations, humanitarian operations, and general operations.

Now, I will never advocate the use of frequencies by persons not legally allowed, by equipment not legally authorized, by non type certified equipment, or any other action that flies in the face of the laws of the United States of America and the Great State of Washington. Ever!

However, given a catastrophe and a mission to protect lives, protect property, restore operations, and communicate, there may be times where I might not be as diligent in policing the means someone legitimately accesses my equipment in good faith and in support of my operations.

Saying that, I know that despite the whiz bang trunking system, we are looking at our other licensed 'legacy' systems with an eye to increasing our abilities in a post disaster environment. Some of the discussions here in the abstract support an increased 'interoperability' and create the opportunity to surge communications with the least cost.

For whatever that's worth..... :)

Its a file that was hosted HERE.
Hence the warning.I understand that .exe files can be re-packaged (compiled) with the trojan onboard, and this doesnt reflect every distribution out there. But with the file floating around nearby, it is in good faith that I mentioned it to everyone.
For all I know its the factory compiled executable, so beware.
And its totally no secret that the chinese hack and snoop like a crack addict smoke his glass pipe. Its not at all unexpected, especially when its so easy to do. It could very well have been a single employee who took the source code and made some groovy "additions", and re-compiled it as a new file.
I would like to craft a file that looks like the windows taskbar, hides the real taskbar upon installation, then waits like a landmine to format the hard disks (all of them) when "start" is pressed. LOL

I've got the battery pack for the KC-UVD1 that operates using 4-AA batteries. On the pack it says NOT to use rechargeable batteries. Any idea why not? Thanks.

I assume that with rechargeable batteries, the voltage will be too low (4 x 1.2V = 4.8V).

Alkaline batteries have a voltage of 1.5V per cell - (4 x 1.5V = 6V).

The KG-UVD1 (P) operates from a nominal 7.4V

Only because I lurk in social media, I've created a Wouxun fan page on Facebook. I've already purchased the KG-UVDP1 version for 136-174/400-470 MHz and am awaiting delivery on two additional units for the 216-280 and 420-520 MHz ranges.

The new Wouxun page on Facebook is at:

http://www.facebook.com/pages/Wouxun/318434678070
(http://www.facebook.com/pages/Wouxun/318434678070)

Has anyone had problems with the USB programming cable? I haven't had mine more than two weeks and I now get an error message on any machine I plug it into saying the USB device has malfunctioned and that Windows doesn't recognize it. I'm assuming the cable went south already. I have two more USB cables coming with my new shipment, so hopefully it's just the cable.

73, Chuck, N2DUP | scanning1.com

You adjust for the offset by entering the tx and rx frequencies independently. For the frequency mode you adjust the offset in the "usable function" window. Hope this helps.

I don't suppose anyone has created a kind of generic VK amateur UHF/VHF file?
ie. With all the simplex frequencies, and then two lots of repeater ones (ie. one with positive offsets, the next with neg offsets)

Otherwise.. I see someone has uploaded the NSW repeaters.. any chance of a batch of the Victorian ones too?

Otherwise I guess I'll set on entering them myself if I get some spare time..

Cheers,
Toby

KG-UVD1P SMA Antenna Connector

Other than the original antenna that came with the radio is anybody having problems with SMA antenna accessories not fitting completely on (seems that the threaded antenna part(s) is not long enough to reach all the way into the radio). I purchased a NAGOYA NA-771, a Stubby Antenna, and an SMA to BNC converter. None of these are long enough to make me feel comfortable that they are giving me a good antenna connection.

Is it top secret or does anybody have the Dealer Program Mode Instructions / Options or know where I can get them?

Snowing in NYC and have a lot of time on my hands to play with the radio

Thanks,

Alan, NY2G

Because the reverse (female)SMA connector is rarely used in amateur radio, I purchased a reverse SMA to BNC adaptor from 409 shop where I bought the radio. This fits really well and I've had no problems connecting my Pryme rubber duck and an outdoor antenna, both of which use BNC.
As for the dealer program mode instructions, I'm not sure what you're referring to. Both the programming and unlock software are available on the links section of this site, I believe.

Good luck from sunny, warm southern California......sorry, I couldn't help myself!

Dan

KG-UVD1P adding Dealer Operation Mode.

There is a way to program the radio without computer and cable through the dealer operation mode Operation Method. From the WOUXUN website "Holding on [8] key and powering on the transceiver at the same time, then inputting password "268160," the transceiver enters dealer operation mode."

Does anybody have the complete list (or tell me where to get them) of programming options in dealer operation mode (not just the instructions from the WOUXUN website?

Greetings, all!

I have been following this and another group for the KG-UVD1 radio, and I must say that I love my little HT. This little guy is GREAT! Very durable and for the most part, easy to use.

I am wondering if anybody has tried using any of the Kenwood radio accessories. In particular the Blu-Comm Blue Tooth Headset found here: http://www.hitechwireless.com/Blu-Comm-2-Way-Radio-Bluetooth-Headset-P1154C139.a\spx

I know that alot of people have had luck using the kenwood programming cable, so I am wondering if this headset would also work.

Anybody have any knowledge on this?

Thanks!

Christopher

Thanks for your reply Dan:

Seems that not all of the adaptors have long enough external threaded part (Female SMA that extends from the adaptor or antenna into the radio) to reach into the top of the radio to make a secure connection. I will order the one from 409 shop and see if that makes a difference.

About the programing...

There is a way to program the radio without computer and cable through the dealer operation mode Operation Method. From the WOUXUN website "Holding on [8] key and powering on the transceiver at the same time, then inputting password "268160," the transceiver enters dealer operation mode."

Does anybody have the complete list (or tell me where to get them) of programming options in dealer operation mode (not just the instructions from the WOUXUN website?

After a ratehr frustrating day, I think I have it:

First of all, DON'T run any of the 'install' files from tjhe CD that comes with the radio!

Assuming you are using the USB connection (I really don't like those - 'traditional' com ports with RS232 are so much less ambiguous) then plug it in and see if your computer recognises the "Prolific" USB connection (it may well do if you have previously used a USB connection for something like Ham Radio Deluxe).

If not, then look for the USB driver for the "Prolific" interface (on my CD it was in D:/programming software/ in a compressed file called USB-DRIVER. Unpack (if it was compressed) and then double-click it. Now your computer should see the interface.

Open Control Panel and go to System, and select Hardware and Device Manager . Scroll down to COM Ports and expand this. You should see one of the COM ports showing "Prolific USB-to-Serial Comm Port (COM x)". In my case it was COM4, but this will depend on which USB port you plugged the cable into. Make a note of the Com Port number.

Now copy the programming program from CD into a suitable directory on the hard drive (UVD1P would probably be a good name for the folder!). The program was called "KG-UVD1-V1.04", with an icon of the radio in D:/programming software/WOUXUN.

Run KG-UVD1-V1.04 and you should get the program opening up in a new window with not much (apparently!) happening. First click on "Com Port" at the top of the screen. Select the COM Port that the Prolific diver shown as connected.

Look on the left side of the window and you can open from there the 3 different sets of radio settings - Channel Message, Usable Function, and Key Set.

Open one of these (Useable Function is good) and then click on the "Program" at the top of the window and then "Read From Radio". If all is well, a 'gas guage' bar should quickly move from left to right at the bottom of the window and, after a few seconds the bar should reach the right-hand side and a message "Read Success" should pop up on the screen (click OK to acknowledge)

If the gas guage sticks after a few bars, then you know that your comms to the radio is not working. No need to wait 5 minutes until it times out before you try something else, as you can just close the window and re-open it.

One thing that caught me out and wasted a lot of time . . . . Make sure that the plug at the radio end is FULLY HOME! Mine tended to 'appear fully plugged in' but the lower jack was not quite all the way, the plug only slightly out of square. Resulting in a lot of fruitless attempts at connecting until I noticed the slight mis-alignment!

Now you can edit the Useable Functions, Key settings, and enter your frequencies/shifts/CTSS in memory via the Channel Messages. Then click Program -> Write to Radio. The 'Gas Guage' again and "Write Success" and your radio will re-boot and you can select the memories with the knob in the middle of the top of the radio!

Apart from that, and the need to still read the awful manual for some operations when in use, it looks like it's going to be a much-loved rig and I'm gonna have a lot of fun with it. Especially if we get a bit more 70cm activity in my location!!

It can also be loaded with the UK's PMR 446 channels, so my XYL can use the little PMR radio and I can (with the power turned down of course) select PMR channels to keep in touch with her!

You have to use the menu 21 and enter everything else. I strongly recommend using the USB cable and software to do all the programing. I also tried programming it via menu 21 and though I was ready to visit the funny farm after an hour. So save your sanity and use the PC to program it.

The only bad thing about using the software is when it come to the names ofthe channels you can't put in spaces between the letters. Also if you need to feild program something in it stays in scan you can't edit scan list from the radio which sucks badly

Topic: 563 Message: 564

I've only just got my lovely little Wouxun, but I think the problem will be your channel spacing setting. Most people will set their rigs up for 25KHz or 12.5KHz spacing. But other options available are 5, 6.25, and 10 KHz (plus some wider ones)

For 155.0025 MHz, you would need 2.5KHz spacing - not available! However, if you set your channel spacing to 5KHz, then you will only be 2.5KHz off-channel so performance will be down a bit I suspect you'd get good enough copy. I think you'd get the same thing with 12.5 KHZ or 25KHz spacing and set the rig to 155 MHz.

For interest - Why do you need such a non-standard spacing? And what is up there just above 155MHz??!!

Hi:

Looking into getting a UVD1P-series HT.
So, which one is the latest with the long DTMF tones and is most recommended
(simplex&repeater 2m/44O usage in the USA)?

KG-UVD1P SP (136-174/400-470Mhz, DTMF NEW Version)
KG-UVD1P U (136-174MHz/400-470MHz, DTMF NEW Version)
KG-UVD1P UH 136-174MHz/400-480MHz, DTMF NEW Version)
KG-UVD1P-UU (136-174MHz/420-520MHz, DTMF NEW Version)
KG-UVD1P VV (136-174/216-280Mhz, DTMF ???)

Appreciated,
AR.

566. Keypad lock

Topic: 566 Message: 566

Hi,
I'm struggling to get the keypad lock to work as described.

According to the manual, the keypad/controls can be locked by holding down the button marked with a key symbol for two seconds.
However if I push that button, either briefly, or for two seconds, then the radio just jumps into the stopwatch mode.

Am I doing something wrong, or is this a bug?

Also, I have found that you can enable an auto-lock of the keypad via the menu, however in this case it will lock the controls after 15 seconds, regardless of if you were using them at the time.. quite annoying! Most radios will lock the keypad after so many seconds of NO activity.

Cheers,
Toby

568. No transmit audio

I have a problem. My new KG-UVD1P radio that covers 420-520 MHz does not transmit audio unless I use a speaker-mic plugged into it. All I get is a dead carrier otherwise. Any thoughts? I'm not liking the thought of shipping this thing back to Hong Kong. I have two other KG-UVD1P radios in different bands that are working just fine.

AR,

I bought one of these about 7 weeks ago (from Solid Radio in China, via eBay) and the full model number is not marked on it. However, from the frequency range marked inside the battery space, it would appear to be the 'UH'.

I have read of the 'short tones' problem but had no problem with my local repeater. I have just checked against another receiver and the tones on mine continue as long as the DTMF key is held down! Should be no problem with short tones now.

I would guess that this change has been introduced 'quietly' with no change in model designations, so probably no way to tell when/if each model was 'upgraded' - or even which 'upgrade' is in stock from a particular vendor! Unless you are able to get confirmation from a vendor of this question, I would suggest that the stock coming from Solid Radio is likely (some 2 months after my own order) to be the latest version, and the UH sub-model has the biggest range of frequencies - unless you would prefer the American 220MHz to the more usual 440 MHz second band.

Overall, it seems to be a nice little rig. As I was working away from home when the radio was delivered, I've only been using it for a week or so but, so far, I am very pleased with it. You certainly can't beat the price (!) and, on 2m, it performs very well; The receive side is good and I get good audio reports and I have worked a hill-top portable station around 40 miles away with the supplied antenna (but buy the adapter so that you can use your shack or mobile antenna as well). I've not tried it on 70cm yet but no reason to think it won't be as good as 2m.

The unit feels solid, and I'm told that there is an aluminium chassis inside. A pity about the S-meter, which shows S9 on anything that breaks the squelch - even at the most sensitive setting, but who really cares about that? The manual leaves quite a lot to be desired, though it might be a lot easier to understand if the original Chinese had been better translated into English! Mine came with a CD that appears to have been compiled for half a dozen different radios and no "read me" file. DON'T run the setup program - for a start, it installs itself in Chinese! Load your serial adapter driver from the CD (assuming you are going to set it up from a computer) and then look for, or unpack, the program KG-UVD-V1.04 (or a later version if you have one) and make sure that the dual-phono plug is WELL pushed home into the radio before transferring data. Repeat - make sure the plug is pushed WELL into the radio!

I find all "menu-driven" radios a bit of a 'pain' to get used to (I have an FT-857 too) but they do give many more features/facilities than the good old switch-driven ones (you'd never get enough switches in the space available!), but getting everything set up via a computer takes most of the pain away.

Overall, I'm very impressed with what I paid for - If they get the manual sorted out, they could give Yaesu/Icom/Kenwood a really good run for their money!

OK, found out how to fix this..
I disabled the "stopwatch timer" in the menu, and now the lock button
works as it should.

Strange though.. and kind of a useless function IMO!

Thanks, Stu!

Excellent summary confirming what I've read so far. The price is just too good to pass up... and an 'absorbable' risk, should it turn out to be a disappointment. I'm also impressed with the low cost of the accessories. Yeah, I'm pretty much sold on the idea of getting one of these.

From: Robbie Phelan
Topic: 565 Message: 574

I got the UVD1P Model last week from http://www.409shop.com/.
DTMF tones work perfect. Can't fault the little rig.

I paid;

€05.58 for the Car Batter Eliminator for KG-UVD1
€75.86 for the
WOUXUN KG-UVD1P VHF UHF / + Earpiece + Prog.Cable
€16.52 for shipping
€27.02
for Customs VAT

Total incl Customs €124.98

It's programmed for all the ISS, FM satellites, Marine & Ham frequencies.

Programming was simple, other it took a while to populate the .tw file with splits and codes etc, but once it's done, it's done.

Happy days.

Ei2iP

Best regards,

Robbie

Subject: [Wouxun_KG-UVD1] Re: UVD1P Model (sub)number confusion...

Thanks, Stu!

Excellent summary confirming what I've read so far. The price is just too good to pass up... and an 'absorbable' risk, should it turn out to be a disappointment. I'm also impressed with the low cost of the accessories. Yeah, I'm pretty much sold on the idea of getting one of these.

AR.

> I bought one of these about 7 weeks ago (from Solid Radio in China, via eBay) and the full model number is not marked on it. However, from the frequency range marked inside the battery space, it would appear to be the 'UH'.

>

> I have read of the 'short tones' problem but had no problem with my local repeater. I have just checked against another receiver and the tones on mine continue as long as the DTMF key is held down! Should be no problem with short tones now.

>

> I would guess that this change has been introduced 'quietly' with no change in model designations, so probably no way to tell when/if each model was 'upgraded' - or even which 'upgrade' is in stock from a particular vendor! Unless you are able to get confirmation from a vendor of this question, I would suggest that the stock coming from Solid Radio is likely (some 2 months after my own order) to be the latest version, and the UH sub-model has the biggest range of frequencies - unless you would prefer the American 220MHz to the more usual 440 MHz second band.

>

> Overall, it seems to be a nice little rig. As I was working away from home when the radio was delivered, I've only been using it for a week or so but, so far, I am very pleased with it. You certainly can't beat the price (!) and, on 2m, it performs very well; The receive side is good and I get good audio reports and I have worked a hill-top portable station around 40 miles away with the supplied antenna (but buy the adapter so that you can use your shack or mobile antenna as well). I've not tried it on 70cm yet but no reason to think it won't be as good as 2m.

>

> The unit feels solid, and I'm told that there is an aluminium chassis inside. A pity about the S-meter, which shows S9 on anything that breaks the squelch - even at the most sensitive setting, but who really cares about that? The manual leaves quite a lot to be desired, though it might be a lot easier to understand if the original Chinese had been better translated into English! Mine came with a CD that appears to have been compiled for half a dozen different radios and no "read me" file. DON'T run the setup program - for a start, it installs itself in Chinese! Load your serial adapter driver from the CD (assuming you are going to set it up from a computer) and then look for, or unpack, the program KG-UVD-V1.04 (or a later version if you have one) and make sure that the dual-phono plug is WELL pushed home into the radio before transferring data. Repeat - make sure the plug is pushed WELL into the radio!

>

> I find all "menu-driven" radios a bit of a 'pain' to get used to (I have an FT-857 too) but they do give many more features/facilities than the good old switch-driven ones (you'd never get enough switches in the space available!), but getting everything set up via a computer takes most of the pain away.

>

> Overall, I'm very impressed with what I paid for - If they get the manual sorted out, they could give Yaesu/Icom/Kenwood a really good run for their money!

Hi,
There is a feature that you can set which either gives a beep as you key the mic and when you let go, or only when you key the mic, or only when you let go. Page 16 of the manual. Look up the "Roger" feature.

Are you talking about a trailing burst of static? ie. Like the squelch
has dropped briefly?
If so, then the lack of that isn't a problem, it's a feature ;)

Just tryed that & it makes a bleep on the other radios on that channel, but nothing on mine.
When I keyed the mic, one of the others users said "what the hell what that"

584. Re: Repeater noise

Hi,
It won't give you the psssht noise. It will give you a beep either on key or after or both. If you want some type of indicator on your end that you keyed the mic set the "ROGER" feature to BOT. It won't give you the psssht sound but it should beep on your end as well as the other radios.

585. Copy from memory channel to working mode?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-11 01:45:14 UTC
From: Toby Wintermute
Topic: 585 Message: 585

Is there a way to transfer the channel data into the frequency mode?

ie. Say I have a channel selected, but want to copy the tx/rx
frequencies and CT/DCS tone settings into the frequency mode so I can
adjust them more?

ta,
Toby

Yeh, maybe but it gives me an indication if I'm within range of the repeater. With a handheld you havent got as much coverage as a mobile unit.

OK, I think you're talking about something else then. You're saying
the squelch is opened by the repeater's tail, right?

If you aren't hearing *that* then perhaps you aren't actually hitting
the repeater properly? Check with another radio to see if you are.

You could also try lowering the squelch level (SQL-LE in the menu I
think) so that the radio opens up sooner?

The noise of the 'tail' will depend on the strength of the received signal from the repeater - if the repeater is fully-quieting your receiver you should not get any noise.

As long as you are getting a good signal from the repeater, you should see the 'busy' LED alight and the S-Meter showing S9 (as most know here, the S-Meter shows S9 on just about anything that will break the squelch, even with the squelch sensitivity set at '1'!!)

Thanks, I got it sorted now.
If I set the squelch 4 or lower I hear the tail.
But I've had to put it back up to 5 as I was getting too much interference.

597. Shipping cost

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-14 13:31:31 UTC
From: fredb29617
Topic: 597 Message: 597

I have been looking on ebay and have noticed that a lot of sellers have inflated there prices for shipping. If we could get a US distributer of this product then we could move in to the area's of low cost or free shipping and better customer support as in returns and repairs.

598. Re: [Wouxun_KG-UVD1] Shipping cost

ummm - there is alittle more to it than this.

Seller's pay EBay fees based on sale price - transfering as portion of your desired selling price point to shipping saves money.

Also my experience with the sellers I have purchased from is that they do use a faster registered service - I routinely get items within 5 business days of my order - from Hong Kong and they know how to fill out declarations.....

These radios are price leaders, period. Please be realistic - if you want service and repairs buy Yaesu or Kenwood from a domestic dealer.

Standing in the aisle at WalMart and complaining you can't get good service
is asking for a bit much.

Remember the old saying: "fast, cheap, good - pick two".

I'm not sure that the Wouxun radios have the FCC approval for sale in the U.S. Sales here require different approvals than importing or use do. Try 409shop.com. They have competitive prices with shipping included.

I agree.
These are low cost radios.
If you want customer support and repairs, and .....
Who will give that support to you, will increase the radio price.
If you have just some experice in buyng in Cina:
-1- The best seller is : Wouxun. I mean buy directly from Wouxun.
It will be best if you find some friend to buy with you, so you can reach at least 5 or 10 radios.
-2- The best customer support, repairs, ecc .... will be you.
I mean you can buy some radios as spare, to use for replacemente of faulty radios.

Best regards.
Francesco

So that they don't get 200 phone calls on pricing, can someone call them and report?

Thanks!

I would be suspicious about "call for pricing". HRO does that same thing in their catalogs and ad's at times and there is a reason for it.

This could be a case of buy in lots of 100 for $90 each and resell to unsuspecting HAMS who don't know they can buy on their own for $104 shipped. No "call for pricing".

Just my thought...

You pay for getting it fast! I bought mine from China and it only took just over a week for it to arrive.

Will TotalRadio give backup? If so, then it could be worth paying a bit more.

If you have just some experice in buyng in Cina:
-1- The best seller is : Wouxun. I mean buy directly from Wouxun.
It will be best if you find some friend to buy with you, so you can reach at least 5 or 10 radios.
-2- The best customer support, repairs, ecc .... will be you.
I mean you can buy some radios as spare, to use for replacemente of faulty radios.

Best regards.
Francesco

605. Re: If we could get a US distributer

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-15 19:36:10 UTC
From: cascadian
Topic: 601 Message: 605

Sorry, while I don't mind a business making it's dime, I refuse to 'call for pricing.' If a business wants to be competitive and be considered for my patronage, they'll put their pricing up for me to see.

I have yet to hear of any pricing advantage that can be gained by a call. Prices change, margins change, and websites are damned easy to change.

And, for the record, HRO doesn't get much of my business either, due to the exact same reason.

BTW, I bought my Wouxun via the net and found it to be easy, simple, and effective. When I buy my next one, I'll do it the same way if their prices are better than the next guy.

From: Ted Seifert Jr
Topic: 601 Message: 606

I agree, but it might be of value if this "distributor" stands by the product and honors any warranty. Otherwise, like you, I am will to wait a little longer for a price that is advertised up front even if it comes from China.

If the price were comparable I would not hesitate to buy or pass a good deal on to my friends but in this case you can't tell without a phone call!

Anyway,

Ted K2TJr

607. Re: [Wouxun_KG-UVD1] If we could get a US distributer

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-15 19:51:34 UTC
From: Ted Seifert Jr
Topic: 601 Message: 607

I agree to a point.

If I knew the price up front I would pass along a good deal to my friends and associates who are looking for one.

☐
You pay for getting it fast! I bought mine from China and it only took just over a week for it to arrive.

Will TotalRadio give backup? If so, then it could be worth paying a bit more.

From: Terry Taylor
Topic: 601 Message: 608

Why does everyone presume that the Chinese sellers are disreputable? I have dealt with several of them and their customer service has been very good. I have even had to deal with warranty issues and they have been as responsive as any domestic dealer I have dealt with. Yes, there can be delays with transportation back and forth, but that can happen with US domestic sellers as well.

Sent: Mon, March 15, 2010 12:44:13 PM
Subject: Re: [Wouxun_KG-UVD1] Re: If we could get a US distributer

I agree, but it might be of value if this "distributor" stands by the product and honors any warranty. Otherwise, like you, I am will to wait a little longer for a price that is advertised up front even if it comes from China.

If the price were comparable I would not hesitate to buy or pass a good deal on to my friends but in this case you can't tell without a phone call!

Anyway,

Ted K2TJr

For what it is worth, HRO DOES SHOW THEIR PRICES on their web site. There is a VERY valid reason fornot publishing the prices in their printed catalog, they change SO OFTEN.

In fact, you may be surprised. I sell in UK a USA product (nothing to do with Radio - a flavouring called "BaconSalt")

Obviously I buy boxes at a time, which makes my per-unit shipping a lot cheaper, the manufacturer gives me a "distributor price", I can still make a moderate mark-up and my customers say that I give them excellent service. So I can sell at exactly the same price as folks in US can buy mail order from Seattle!

Stu, G3OCR

I agree to a point.

If I knew the price up front I would pass along a good deal to my friends and associates who are looking for one.

☐

You pay for getting it fast! I bought mine from China and it only took just over a week for it to arrive.

Will TotalRadio give backup? If so, then it could be worth paying a bit more.

I would be suspicious about "call for pricing". HRO does that same thing in their catalogs and ad's at times and there is a reason for it.

This could be a case of buy in lots of 100 for $90 each and resell to unsuspecting HAMS who don't know they can buy on their own for $104 shipped. No "call for pricing".

Just my thought...

I have been looking on ebay and have noticed that a lot of sellers have inflated there prices for shipping. If we could get a US distributer of this product then we could move in to the area's of low cost or free shipping and better customer support as in returns and repairs.

ummm - there is alittle more to it than this.

Seller's pay EBay fees based on sale price - transfering as portion of your desired selling price point to shipping saves money.

Also my experience with the sellers I have purchased from is that they do use a faster registered service - I routinely get items within 5 business days of my order - from Hong Kong and they know how to fill out declarations. ..... .

These radios are price leaders, period. Please be realistic - if you want service and repairs buy Yaesu or Kenwood from a domestic dealer.

Standing in the aisle at WalMart and complaining you can't get good service is asking for a bit much.

Remember the old saying: "fast, cheap, good - pick two".

I'm not sure that the Wouxun radios have the FCC approval for sale in the U.S. Sales here require different approvals than importing or use do. Try 409shop.com. They have competitive prices with shipping included.

I agree.
These are low cost radios.
If you want customer support and repairs, and .....
Who will give that support to you, will increase the radio price.

If you have just some experice in buyng in Cina:
-1- The best seller is : Wouxun. I mean buy directly from Wouxun.
It will be best if you find some friend to buy with you, so you can reach at least 5 or 10 radios.
-2- The best customer support, repairs, ecc .... will be you.
I mean you can buy some radios as spare, to use for replacemente of faulty radios.

Best regards.
Francesco

I have had no problem with the Hong Kong based sellers on eBay purchasing many radio related items. The good thing about eBay is the rating system usually weeds out the disreputable sellers.

As for the US seller listed earlier, if he get's hundreds of calls wanting a price that is his problem, it might encourage him to post a price.

** One last request guys can you please trim your posts, it get's very tiring scrolling down through irrellevant old crap that I have read numerous times before!

I checked out the 409 site and you are correct as far as i know they have the lowest price and FREE SHIPPING. So you can't go wrong with getting your next unit from them.

This is available through the www.409shop.com folks. I had mine in a week from Hong Kong to Ohio. Even had tracking number to watch its progress. Have placed several orders with these guys (this is not an endorsement nor do I have any interest in their success) and never a problem. They are big Ebay sellers as well.

I've been monitoring the traffic here for a while...

So far we have:

http://www.409shop.com/
http://www.radioshop888.com/
http://www.totalradioservice.com/

Any others?

And, what are the usernames of the ebay sellers that are reputable?

620. KG-UVD1P RX/TX Frequency Range

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-18 21:17:09 UTC
From: RJ Stiles
Topic: 620 Message: 620

Could someone tell me what the transmit and receive frequency ranges for the various sub-models of the KG-UVD1P are? I found an eBay seller (http://stores.ebay.com/solidradio) who is selling a radio that they say has a UHF receive frequency range of 350-470MHz and a UHF transmit frequency range of 400-470MHz. On the Wouxun website (http://www.wouxun.com/Two-Way-Radio/KG-UVD1P.htm) the closest specifications I see are 350-470MHz RX/TX and 400-470MHz RX/TX. So, who's got the wrong specifications posted?

By the way, I tried emailing Wouxun to get some clarification and it was one of the more frustrating customer service experiences I've ever had. The representative seemed to understand most of the words that I was using, but completely missed the point of the question. In our correspondence, I asked the same question three different ways and each time received a new answer that had absolutely nothing to do with my question. That's when I gave up and figured I'd ask it here.

Hi there,

As per the manufacturer's website at http://www.wouxun.com/Two-Way-Radio/KG-UVD1P.htm, there are eight versions, with frequency coverage as follows:
136-174&350-470 MHz (RX/TX)
136-174&400-480 MHz (RX/TX)
136-174&420-520 MHz (RX/TX)
136-174&400-470 MHz (RX/TX)
136-174&245-250 MHz (RX/TX)
136-174&216-280 MHz (RX/TX)
136-174&225-226 MHz (RX/TX)
144-146&430-440 MHz (RX/TX)

All versions receive FM: 76-108 MHz

David

Hi,
As David mentionned the frequency ranges below are the official one from Wouxun but the KG-UVD1P is indeed able transmit and receive a bit outside of these.
You will find a post from "circruitbrnr" in the archive of the group with some info based on his experiments. A couple of weeks ago he posted to the list that he was about to do some more testing on this to find the limits of what the rig is capable of. I hope he will post back to the group with his findings.
Cheers,

/jmc

From: circuitbrnr@hotmail.com
Topic: 620 Message: 623

I posted this in december after bench testing my radio.
Your version of the KGUVD1P my vary as there are at least 3 different platforms.

Heres the unlocked potential of this radio and its VFO.

(only for the technical aspect of determining the operating capabilities of the radio in question's VFO range)

100 mhz-999 mhz_____ receive(continuous tuning_all frequencies) (and maybe higher outside of display range [wow])

119.7 mhz-213 mhz_____ transmit(VHF) /

400 mhz-506 mhz_____ transmit(UHF)

so it cant transmit above 213 mhz, until you hit 400.

since it transmits at 120 up, it makes an aviation capable radio too.

although this radio isnt rated for that duty , officially.

Any technicians setting these radios up, beware of trying more than this as you can lock the firmware on the VFO and wont be able to revert back.

I managed to pull it back from the brink, but Ive heard of them sticking and not accepting programming or updating or unlocking/re-locking.

(it can stick on the out of range freq scheme, and reject USB cable programming, if you go to far---strange.)

I thought I was going to have to re-order another radio before I saved it. beware.

Yea it was pasted the way I typed it months ago...
We played with it at the local airport as our friends at metro aviation fly their Bo-105 helicopters out of the airport using their FM handy talkies. Obviously no good for control tower... but the unit can still be used to trigger the airports landing lights and dim or brighten them on approach like an AM radio.

626. Communications Problem with USB Cable

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-21 01:47:19 UTC
From: n1olo
Topic: 626 Message: 626

I received my radio by Post today. I seem to be having a problem programming my radio with the supplied cable. I have checked the cable and it does work. I used it to program my Kenwood radio without any issue. When using the KG-UVD1 v1.04 software the program does not show the COM port assigned to the cable as available. Instead it shows another COM port. For instance, if the DEVICE MANAGER shows the cable as COM5 the KG-UVD1 v1.04 software shows COM6.

I tried using the SetCOM utility without any success. I've removed and reinstalled the drivers.

I've also tried the v1.13 software I just downloaded from the FILES area in this group. Still won't talk to the radio. I'd hate to ship this back to HK after waiting a week for it.

Any other suggestions you have would be appreciated.

reinstalled the drivers.

I've also tried the v1.13 software I just downloaded from the FILES area in
this group. Still won't talk to the radio. I'd hate to ship this back to HK
after waiting a week for it.

Any other suggestions you have would be appreciated.

John,

I had to install Prolific PL-2303 USB Driver, and then set it to one of the free ports that the Wouxun program listed as avail, in my case it was Com2.

This is exact driver for any usb or port com rs-232 adapter, is very
dificult to program with other.

All interface adapter are Prolific chip included.

http://www.prolific.com.tw/support/files//IO%20Cable/PL-2303/Drivers%20-%20G
eneric/Windows/allinone/PL2303_Prolific_DriverInstaller_v110.zip

73
Enrique LU8EFF

PD. Do not use driver included in the mini CD of the usb programmer, not
work appropiated.

Hi guys,

New to this group and new owner of this radio. So far I'm quite pleased except for one thing. Hopefully I'm not doing something right, or there is a work-around. While scanning memories, if I turn the radio off, it will not resume scanning when I turn it back on (unless I press and hold the scan* key). I'd like for it to automatically resume scanning. Is there a way to make this happen?

Thanks,
Kingfish

I don't understand the problem - why would you NED to have it resume scan? Surely if "operator input" is being given to turn it on, there's not much effort required to push the scan button again?

Hey Colin,
I have Windows 7 (64 bit version) and have been using the USB programming cable with my Wouxun.
I think I just used the drivers off the CD, and the latest version of the programming software (attached to this group in the files section).. It worked fine for me!

As others have suggested, make sure you plug the programming into the radio first, and ensure the plug is well seated, and only then plug it into the USB port of the computer.
Make sure you go to the "com port selection" option in the programming software, and select the correct port.

ta,
Toby

Ok,

I've tried different computers and three different versions of the software. I've made sure that the plugs on the cable are fully engaged. I've reconfirmed that the cable is working by programming my TH-G71. Unless anyone has a better suggestion I think its time to ship it back to Hong Kong.

If you are confident of a bit of DIY, it may be a case od bent contacts. Use a torch and try to see if teh pins etc in teh two holes are bent and not making ocntact. If so use a thin wire or something to straighten them out.

Before that check out if your headset works. If teh hedset works may be an issue with the circuit, if headset does not work too most prolly bent pins.

Hi John, I feel your pain. Could I ask you to check just one more thing?

I noticed in the read me file that came in my software disc that you must force one of your COM ports to be COM 1 even if it's already assigned to something else. Here's what the read me file sez cut and pasted...

after install the usb driver,
go control panel, system, Hardware, device manager,
Ports (COM & LPT)
Port settings
Advanced
set COM port number to "COM1", not "com2, com3 etc)
after done should see
"Prolific USB-to-Serial Comm Port (COM1)"

I hope this helps you. Ted (K2TJr)

Hmm, yes.. if you can confirm it's working on another radio like that, then it does point to the Wouxun probably being faulty.

Here's a thought though, to test the plugs. Can you plug in the hands-free kit (speaker-mic) for the Wouxun, and see if it works? It uses some of the same pins, so if they were dodgy then you'd think the speaker-mic wouldn't work either.

Hi John, I feel your pain. Could I ask you to check just one more thing?

I noticed in the read me file that came in my software disc that you must force one of your COM ports to be COM 1 even if it's already assigned to something else. Here's what the read me file sez cut and pasted...

after install the usb driver,
go control panel, system, Hardware, device manager,
Ports (COM & LPT)
Port settings
Advanced
set COM port number to "COM1", not "com2, com3 etc)
after done should see
"Prolific USB-to-Serial Comm Port (COM1)"

I hope this helps you. Ted (K2TJr)

Ok,

I've tried different computers and three different versions of the software. I've made sure that the plugs on the cable are fully engaged. I've reconfirmed that the cable is working by programming my TH-G71. Unless anyone has a better suggestion I think its time to ship it back to Hong Kong.

Make sure that the plugs at the Wouxon end are FULLY in. I have several times been cursing that the com is not working, only to find that the pugs were not all the way home!

Subject: [Wouxun_KG-UVD1] Communications Problem with USB Cable

I received my radio by Post today. I seem to be having a problem programming my radio with the supplied cable. I have checked the cable and it does work. I used it to program my Kenwood radio without any issue. When using the KG-UVD1 v1.04 software the program does not show the COM port assigned to the cable as available. Instead it shows another COM port. For instance, if the DEVICE MANAGER shows the cable as COM5 the KG-UVD1 v1.04 software shows COM6.

I tried using the SetCOM utility without any success. I've removed and reinstalled the drivers.

I've also tried the v1.13 software I just downloaded from the FILES area in this group. Still won't talk to the radio. I'd hate to ship this back to HK after waiting a week for it.

Any other suggestions you have would be appreciated.

Hello,

I have a problem with the Wouxun Kg Uvd1 .In 2 m band after 1-2 min TX and Rx transceiver is freezing. Keypad and keys works but I cannot receive and transmitted. In 400-470 MHz (PMR band) radio works very well.

I suspect some problems with software because sometimes when I try to change working mode, the transceiver reboot.

Can you help me?

Best regards,

You are falling foul of your channel-spacing setting. You need to set channel-spacing correctly to accommodate the frequencies you use. (25kc/15kc/12.5kc/10 etc, etc

From: steve_ve6vs
Topic: 650 Message: 650

We have several Wouxuns and Puxing which use the same programming cord. I use an aftermarket speaker mike and have dropped the radios and found the programming cord would no longer work. I attribute this to the PTT connection in the radio failing. Since we have several I tried several mikes and programming cords and found some work and some don't. I switched cords and presto I can program again. It is probably a case of accumulating tolerances since if you use a micrometer on the pins you will get different results depending on the supplier. The solution is to try another cord from a different supplier. $10 from 409 or Kawamall. Inconvenient waiting two weeks but you may have no other choice.

Stu is correct.

Press MENU then 01 if it does not default there.
Press MENU again and up/down arrow to set freq. steps that will allow freq ending on 5.
Press MENU again to set.

Should be good to go!

From: Michael Dodds
Topic: 653 Message: 653

Hi,
I recently got one of these radios and have successfully programmed everything I need except for 1 option: Is there a way to make it start up without the dual standby option on? It's running in channel name mode, and I just want 1 line to display with the channel. I have to hit the TDR button each time I start the radio to do this and I can't find an option anywhere in the radio or the software to turn this off.

Thanks,
Mike

Yes. It should be in the front of the manual, I think the
quick-reference page? They call the VFO mode "working mode" though.

Leave the programming cord disconnected

Open your control panel and go to device manager then open the com settings.

Plug in the cable and watch which COM opens up.

My computer has too many USB ports and they are not organized in an orderly fashion.

I don't expect anything like that will exsist or even possible. The most we
could possibly expect is someone to write a much improved programming
interferace, the Wouxun software is just average but at least it works.

Good morning Wouxon fans! (Good evening to those in USA!)

I've dropped a line to Bob Freeth (G4HFQ), who makes a great little program for the Yaesu FT range that looks like the interface for the Wouxon, but has Excel-like features (drag/drop a group of channels form one set of memory locations to another, detect the com port in use) but much easier to use (and in English by default!)

I suggested that he might like to look at making a version for the Wouxon, as it would appear that there's a lot of people who, like me, love the radio but don't think a lot of the keyboard memory programming or the clumsy programming software that comes with it, and a good market for a decent programming interface at a tenner ($15 to our USA brethren)

Hopefully he will take on the challenge, as Bob's Yaesu software is lovely to use and 'works out of the box'. I bought the FT software and I'd buy a Wouxon version!

Stu (G3OCR)

Great stuff Stew, I am a fan of Bob's software and he supports it very well indeed. I would certainly purchase it if he made a copy for this radio and recommend others to as well.

I would be pissed off if people wanted to pirate (or bootleg) his software because he is an indivdual that stands by his product.

If you want a 'single channel', make A & B the same. Not a perfect solution. If you have a newer P series radio the transmit stays on the selected channel rather than jumping to the active channel like the older ones did.

I have listed a few week ago the Vista driver program, this should help.
The driver that came with the radio was for XP.

Thanks for the reply Steve,
I have noticed that it doesn't jump to the active channel like I had read about earlier models doing. My only gripe is that I don't need or want the B display. I have all my freqs programmed in, and I basically just want to use those in channel name format and not have the second line display at all.
I have noticed a quirk with the (surprisingly useful) LED flashlight function: I can't turn it on or off if the radio is active, only when it's in standby.

I just got one with all the goodies. It seems to work nice. I did turn the deviation up as it was very low on the wide setting. I also bought a SMA barrel and put my long antenna on. I got it all programmed no problem but was not able to copy my existing menu from the other program into this one. I had to do it all manual. Once done as I was trying the short cuts, if I have it in the name ch mode and hit menu then TDR it puts it in ch mode and then I have to go back into the menu to change it back to NAME to display.
It does have some goofy quirks to it but nothing that cant be gotten around. For the price and the fact it works well is worth it to me.
I got mine from the 409 shop. It only took 1 week to get here!
The 1400mah battery last a long time and I also got the 1700mah one too.
The audio is not like the vx3 or any of the others I have but its good. The 5W will defiantly help when I am not near by any repeaters or using my mobile as a cross band. I would still like to get a vx8r! But if I keep this one it will work fine for me. Amie N9OXO

Wouxun is a nice radio but it can't walk and chew gum at the same time. You can't key enter a new channel while the radio is active.
I have to use the knob to get off the active channel to use the keypad. But in comparison to my old 16 channel keypad only Icom H-16 this is rocket science.

Next project is some AA holders with 2200 mAH batteries and a drop in charger. Also some SMA pigtails to whatever connector for external antennas. This will take stress off the SMA connector from having a piece of RG cable and a heavy connector hanging on it. SMA connectors are meant for fixed microwave use (see April 2010 QST)

I found a hard leather case for a Vertex Standard with a belt swivel that takes the Wouxun and covers over the keyboard to prevent accidental keypad operation.

Topic: 678 Message: 678

Yes there is a pic in the files. It also says MOD right above it on the board. Just take the two TORX screws out and it will lift out. There is a flat ribbon connecting the boards so be carefull! Its a tight fit so be carfull prying it out! It has a rubber gasket all the way around. When you turn the pot look close where the flat side is, put it at about the 7 o'clock position, or same as bottum left. If you turn it too far it will not have any audio as there is NO stop point on it. If you can manage, hold the battery on the radio, while leaving it turned on and test it out before you button it up to make sure you didnt turn it too far. I laid the battery flat on my bench, then placed the radio on it as to NOT dead short it then managed to key to test it out. I got it the first time and got out of there!! It is not as clear and sharp as the vx2 or vx3 but LOTS better than it was.
I wet the gasket when I put it back in so it didnt roll up! Just wet my finger with some rubbing alcohol and applied it and it popped right in place. Also there is a mod out there for improving the modulation but it is for the older radio. Dont do it! on this one. When I got mine I included the case for it and it was only 7 bucks! It even had a long strap to clip onto it. It has a cut out for the belt clip too. The spare battery came with a belt clip so I have 2 of them :) Rat shack has the SMA barrel and the SMA to pl239 if you wanted to hook it to a mobile antenna or base etc. the part numbers are 278-013 for the barrel and 278-o12 for the sma to 239. It has 1.5 ft. of coax on it so there wouldnt be any stress on the radio.I also found them on ebay cheaper but wanted one right now! I did order a few off ebay for spares and for the others who have this radio that I know of. I put my JT776SMA antenna on it and it made a world of difference! I could bring up repeaters 20 miles fome me from inside the house! Plus I could hear a lot better too. The jetstream is a well made and inexpensive antenna. Its flexble but not like the real thin wire kind. I dont like them to well and have broken one. It didnt take much and it snapped off right at the base!
Both the diamond srh77ca and the jetstream are good duel band antennas and about the same cost! I have both. Thats what I use on the vx2 and vx3 and now on the wouxun. .... AMie N9OXO

679. How to input frequency info into memory/channel

685. High-capacity AA batteries in battery pack?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-03-30 22:13:06 UTC
From: Stu Nutt
Topic: 685 Message: 685

Steve,

I noticed this in your post on the 'dual-standby'.

My "empty" battery pack comes with a warning on it not to use NiCads (presumably or NiMh batteries). Well, the pack won't fit into he supplied charger, and doesn't have the connections (4) for rechargeable batteries.

Okay, you can charge the batteries (5 of them) in a separate charger, but this will only give 5 x 1.2 volts = 6 volts, instead of the 7.5 volts that the radio is designed for (5 x AA alkaline = 7.5v). How will the radio perform with only 6 volts from the battery pack? How long before the voltage (even if enough when fully-charged) drops too low to operate the radio?

Nicads and NiMh require a different charging circuit to LiOn batteries, this is why the battery cases don't have the built in charging tabs because of the potential of charging problems.

With the cost of the Wouxun rechargable batteries there is no reason why you would bother using recharcargable batteries in the battery case, really it is designed for when you are unable recharge batteries and need to keep using your radio so you throw in the alkalines and then throw them out afterwards.

The battery case is ideal just to have in a 'go bag' or 'ready bag' for emergency purposes.

Full discharge voltage for Lithium Ion batteries is 3.0v per cell, so the radio should operate down to 6V. Below that there should be a battery protection circuit to keep the battery from over-discharge. This would explain the warning about using rechargeable AA cells.

Thanks for that Simon (Templar? not really? surely?!) I probably should have ordered the spare rechargeable when I bought the radio - but I was thinking "surely can't be much good at that price" (how wrong I was!). I'll definitely buy the high-capacity battery-pack as a spare when I place another order for the leather case (I've dropped the rig a couple of times and so far no problems, but why tempt fate!)

BTW - The RX seems comparable in sensitivity to my FT-957 (I messed up the 857's settings just before going on a long trip and had to use the Wouxon as my 'mobile' for a weekend with the car's mag-mount). The supplied antenna seems to work well but I'd like to find something better, preferably covering 2m and 70cm - does anyone know where I can get something like the SRH77CA in UK? A full 1/4-wave on 2m and collinear on 70?

Subject: Re: [Wouxun_KG-UVD1] High-capacity AA batteries in battery pack?

On Wed, Mar 31, 2010 at 09:13, Stu Nutt <stunutt@gmail.com> wrote:

My "empty" battery pack comes with a warning on it not to use NiCads (presumably or NiMh batteries). Well, the pack won't fit into he supplied charger, and doesn't have the connections (4) for rechargeable batteries.

Nicads and NiMh require a different charging circuit to LiOn batteries, this is why the battery cases don't have the built in charging tabs because of the potential of charging problems.

Okay, you can charge the batteries (5 of them) in a separate charger, but this will only give 5 x 1.2 volts = 6 volts, instead of the 7.5 volts that the radio is designed for (5 x AA alkaline = 7.5v). How will the radio perform with only 6 volts from the battery pack? How long before the voltage (even if enough when fully-charged) drops too low to operate the radio?

With the cost of the Wouxun rechargable batteries there is no reason why you would bother using recharcargable batteries in the battery case, really it is designed for when you are unable recharge batteries and need to keep using your radio so you throw in the alkalines and then throw them out afterwards.

The battery case is ideal just to have in a 'go bag' or 'ready bag' for emergency purposes.

I do not like win 7! Or vista! I had 7 on my machine for one week until I dumped it! It is not very user friendly IMO. I use win xp pro and several of the linux OS. 7 seems to take over the entire system and is picky on drivers! I installed the drivers and then the newest program, then re booted, launched the program,located the com port in device manager and then went to ports in the program. That was it! It read the radio no problem then it wrote to it just fine too.
People who are new to the PC world seem to be OK with 7 but us old goats have most likely tried all of the OS systems. I like XP PRO. It works for me :) Amie N9OXO

That is why I bought a spare lipo. I figure if I am going to need to re charge ANY of my equipment in the field I will have the means to do so and not worry about alkaline. Amie N9OXO

Realizing that high capacity batteries start off at only 1.2 volts the thought was that the extra capacity would extend life until the voltage became critical. If it doesn't work oh well. The AA cases are going in a go kit with a box of alkalines as back up 'in case'

As far as li-ion they should work in the Wouxun which specifies operating voltage as 7.4 volts. By calculation the 5 battery case would be 1 cell space short for NiMH and three li-ion and dummy cells will be over voltage. But when I power mine on the voltage indicator shows the batteries at 8.2 volts. So would li-ion be pushing the envelope for voltage tolerance?

Would that affect the warranty? When I got these sending them back for repair was never even an option. Do I want to smoke one?

A question I can't answer but I throw it out. Since I can get the battery charger analyzer recently reviewed in QST (I can't find it) would two li-ion, two NiMh and a dummy meet the voltage requirements? The charger would handle different types so charging would not be difficult.

That makes sense as the nominal voltage of Li Ion batteries is 3.7 - 3.8V. Fully charged you should read 4.2V per cell or 8.4V as indicated. I'm sure that the designers took this into consideration in their design.

Lithium chemistry batteries are designed to deliver a consistent voltage throughout their discharge cycle with a steep drop in voltage as the charge is used up.

2 + 2 plus a dummy sounds like it would give around the right voltage, but I'd be concerned that one pair would be reverse-charged when the pack gets near to flat, doing them no good at all; maybe okay if they were never allowed to fully run down (would the rig shut off from under-voltage before that?

Another approach (though messy) might be to add an extra set of battery contacts on one side, outside, so we could use SIX batteries at 1.2 volts.

I started working satellites with my wouxun, using no amp, just 5 watts.
In particular ECHO (AO-51) is easy to hit its QRP repeater, and the bird has a footprint of about 2500 miles or more.
Its uplink is 2m (145.880), and its downlink is 70cm (435.150)... so clever programming of this dual band radio is important since theres doppler shift to deal with during its 10 minute passes.
(just like the sound of a trains horn is higher when its coming at you, and is lower in pitch when it passes by...when the satellite is approaching at thousands of miles an hour, you set your transmit frequencies 10kc LOWER than nominal [145.870], and step it up 5kc per step as it flies overhead and then downrange...a 20kc wide shift during the entire pass. when its distance to you flattens out during the middle of its pass, you will be at its nominal frequency of [145.880]...and as it flies downrange from you you have to go as far as [145.890] at the end of its pass...---on the receiver side, you start 10 kc over nominal frequency(435.160) and step it down in 5kc steps as it flies by...<inverted tuning>...at the end of its fly-by your receiver will be at [435.140])
So to say the least, between tuning for the doppler-shift, and repositioning you antenna, its quite involved! lol

I may hold the current range record with one of these little radios.
If anyone else has worked longer range station with your wouxun, post results here on this thread.

Venezuela is a pretty good hop with a chinese handheld at 5 watts.

Am regularly using the KG for AMSAt work on AO-51, SO-50, AO-27, HO-68. One tip....doppler impacts receive but no need to adjust transmit frequency as you can leave it alone. Have programmed 5 sets of tx and rx freq adjusted at 5kc spacing for each bird as follows AQ(aquisition of signal), 2,mid, 3 and LOS (LOS of signal). A great little satellite radio with a hand held log periodic beam (ELK antenna) makes for a lot of fun in these down sunspot times.

From: Steve
Topic: 702 Message: 702

I just uploaded one of my KG-UVD1 files that has AMSAT frequencies listed on Channels 2-24. AMSAT frequencies included for AO-51, HO-68, AO-27 & SO-50 (same frequencies) and SO-67. If any are interested in getting started you may also want to go to the Orbitron web site and download(free) a neat piece of tracking software to monitor orbits of the "birds" over your location.

For those asking about the ELk....here's their website

http://www.elkantennas.com/2m4405element.htm

I have no financial interest in the site or company just have good experience using the product. ARROW also makes a competing product.

Steve

There is also a simple home brew antenna, although it would require a
diplexer, whereas the log periodic does not. Kent's Cheap Yagi designs
work well.

From: John Kalotai
Topic: 626 Message: 707

So those of you that have been successful using the USB cable to program: Is there any particular menu setting you use to communicate with the radio? Apparently the radio I just returned works fine with the cable at Radiosho888.com .

Anybody do a good step by step for programming?

John N1OLO

Try hooking up the USB cable and plugging it in to the radio before opening the programming software. I had a problem on XP pro and using that sequence solved it.

Thank You,

Brian N2KGC

I'm looking for a simple(ish) circuit to make two handhelds into a cross band repeater for our ARES go kit. I have several brands of radios that use the Kenwood style two pin speaker mike. Since Asian speaker mikes are so cheap I am considering butchering some to make the harness. I'm not sure if the cloning cable has enough wires.

Not be easier to get a secondhand Alinco DJ-G5?

They do crossband repeat as standard.

714. New Wouxun HT's For Sale - a one-time post

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-03 02:02:50 UTC
From: Ed Griffin
Topic: 714 Message: 714

This one-time post is by permission of Moderator Steve Rish, K8SAR.

My second order for radios will be placed on Monday April 5th, as I test the waters as a state-side dealer for Wouxun. It is hard to compete with Chinese eBay sellers (Wouxun has warned them to get prices higher) but here goes.

For US customers only. Priority Mail Shipping. Payment via Credit Card or PayPal.

Package deal includes:
1- KG-UVD1P (136-174 & 350-470) unless otherwise chosen
1- 1700 mAh Battery (extra battery)
1- AA Battery Shell
1- Battery Eliminator (battery shell with cigarette lighter plug)
1- USB Programming Cable & Software
1- Leather Case
1- Antenna Adapter (BNC)
$159 + $10 Priority Mail Shipping w/insurance

Radio only deal:
1- KG-UVD1P (you chose the model)
inc. Radio,Antenna,Battery,Charger,Beltclip,Handstrap,Manual &
Warranty Card
$118 + $10 Priority Mail Shipping w/insurance

This offer ends and payment must be completed by Monday morning 4/5/2010 at 9am EDT. Please direct any comments or questions via direct email to kmaantennas (at) ctc (dot) net

Now THAT is a really neat idea! Two of these little Wouxons would cost just a couple of hundred $ (£130 or so in UK) and a bit of home-constructed logic could make up the interface. Add two simple home-brewed 1/4-wave ground planes or even coax collinears and a length of coax feeder and you're there!

ARES/Raynet etc - Costs to your group would probably be about $10 per member!

Topic: 717 Message: 717

Okay, you've put all of the frequencies for your nearby repeaters, and the simplex channel, vhf and uhf, so what else?

If you are ARES/RAYNET (or other emergency group) then you can program those channels in, but think about your FRS or PMR446. If you take part in emergency groups, this could be great for liaising with your user service, and also for keeping in contact with the kids, or XYL (or OM!). At the 1-watt low power stting, you are a bit "QRO" for PMR446 (and probably for FRS) but I doubt if anyone is going to argue over 3dBs.

I've put FRS in mine for visits to my daughter in USA, and I have PMR446 for UK use, and my XYL has a PMR set in the house so I can tune the "alternate" frequency to this and she only has to give me a call when the food is ready (!) and we use the same system if we re out, shopping or in the countryside Geocaching, so that we can call each other any time we get separated. FRS and PMR446 work fine on the Wouxon. (As they do on the FT857, but let's not even think about all those over-limit dBs, plus the 6dB antenna, unless it's a REAL LIFE emergency!)

It may have a few niggles (like the S-Meter that reads S9 if anything breaks the squelch!) but, after 3 weeks of using it, I think mine is easily worth twice what I paid for it compared with KenYaesCom!

Anyone seen a manual for these? I would like to know what they use for detecting a signal. Do they use CTCSS (PL) or just rely on any audio from the connected radios when the squelch opens? No squelch output is available from the handheld connectors so I'm rather curious.

These are audio driven. You should use CTCSS in the receiving radio to prevent the 'repeater' from keying up on any signal.

There is one problem with this setup, which I realized after I wrote my original post. This repeater can't be cross band and having two V or U portables close will cause some desense issues. How bad is going to depend. What I need is a bi-directional. It has to work in both directions. The cross band function of some ham mobiles or portables will do this but we have an excess of Puxing and Wouxun and this would be a cable and magic box to put in the go kit. I have a plan to use a sound card interface which provides keying (http://kh6ty.home.comcast.net/~kh6ty/). I'll use two and wire in an inhibit to keep the unused direction from keying up. The reason for this circuit is that it is what we will be using for the NBEM controller also.

Plan B is a couple of Motorola PAC-RT wired together. The only problem they are crystal controlled and I would like more flexibility.

I keep a flash drive and programming software in my go kit with a number of frequency scenarios for my ARES kit. Regular amateur repeater and simplex channels, FRS, weather, law enforcement monitoring, the marine calling channel, our Salvation Army commercial channels and a channels that can be used to communicate with school buses and construction equipment during full scale emergencies. I'm working on the regional frequency data base to have a list of everything we might possibly need. CTCSS is a minor problem the P series will scan for the code in use. I'm also working on a NBEM interface to send digital traffic over the handhelds.

Why can't this repeater be cross band? I would have thought that it didn't matter what frequency (or band) the radios were on that the interface would still work. The only problem with working on the same band, especially with a small frequency offset, would be desensing. I do have a home brew setup with a pair of Maxon data radios that works well for linking two repeaters together. This uses CTCSS for the switching though and works well. desensing is not a problem as it's usually used quite close to one repeater so signal strength is high and the radio is used with a 20dB attenuator in the antenna lead. No desensing!

The software provided by Wouxun is very basic and only just does the job,
cut and paste is sadly beyond it's capability.

In a previous thread it was mentioned that Bob G4HFQ was contacted to see if
he might be interested in writing an application to replace Wouxun's. I
don't believe there has been any response at this time.

There are quite a few files uploaded to the yahoo group which should be a good grounding to get you started.

You can cut and paste on the software but it has to be done line by line.

Any way at most it should only take 15mins to create a new file for the Wouxun as it's memory size is quite small.

Best regards,

Robbie

Subject: Re: [Wouxun_KG-UVD1] Cut and paste frequency lists?

The software provided by Wouxun is very basic and only just does the job, cut and paste is sadly beyond it's capability.

In a previous thread it was mentioned that Bob G4HFQ was contacted to see if he might be interested in writing an application to replace Wouxun's. I don't believe there has been any response at this time.

On Mon, Apr 5, 2010 at 05:37, Brian Webster <radiowebst@yahoo.com> wrote:

If there any way to do bulk cut and paste frequency data in
to a file and then load it to the radio through the programming software?

Bob Freeth has come back to me with a response (below) to my suggestion that he might like to make a version of FTBasicMMO for the Wouxon. He appears to be kinda busy with versions for new Yaesus, but hopefully he can do something for us after that. I'll certainly have my tenner ready when he can do it!

"Yes, I looked at the file and it seems like the sort of thing one expects to
see for a radio image. To take things further requires buying a radio but
right now I am in the middle of programming the 5 recent Yaesu radios -
FT-1900, FT-2900, FT-7900, FT-250 and FT-270. After that I need to do the
VX-8DR and FTM-350 so time is at a premium.

When things quieten down I will take another look at the Wouxon.

73,
Bob G4HFQ

Thanks for the update Stu, looks like it will be a bit of a wait but I'm sure Bob will eventually provide a great product for us. His support is second to none for his existing products, I am a big fan of his.

Hi all,

I've been looking in to this as I was having trouble making the official proprietary software work with Linux. I have had some success sniffing the serial protocols that Wouxun have used.

If anyone is interested in getting a project going, I'd be more than willing to help.

Matt Grice de M6FNG

Hi Matt,
I've hacked about with some other hardware from time to time - old Delco ECUs, the Sony NetMD, old iRivers, etc, and I'd be up for some work on some Wouxun software too.. I was vaguely considering it on the weekend, although I was just thinking of making something that generated compatible .tw files.

The two projects aren't entirely incompatible. What languages do you use Toby?

Matt -

I've had success running the app under WINE (in Ubuntu). Have you tried that?

I bought a comm port progamming cable from Radio409 (Comm Port version and has the DB9 Female, 3.5 mm & 2.5 mm audio plug, RJ-11 6 pin) and 'somewhere' between Hong Kong and here the driver disk was damaged. They are sending another (read: be here in 2 weeks) and I need to set up the lap top for the go kit sooner. Does anyone have a copy they can e-mail?

I presume all you need is the programming software as there won't be any drivers required for the serial port type of cable.
You can download the software from here:
http://www.wouxun.com/down_01.asp?SortID=4&SortPath=0,4,

Grant, ZL2BK
IRLP nodes 6285 and 6081

The cord came with a driver disk and according to them it needs a driver to make it work. Right now I have installed programming software version 1.13 (the latest?) and it won't see the radio.

Plug the cord in to the radio then to the adapter then start the program.
That's how I had to do it and get it to work on XP pro. I used a different
serial to USB adapter however.

Thank You,
Brian N2KGC

You have to go to the menu mode and set the display option to either channel/freq , name plus channel or channel. It's not real intuitive. Once you do that you can rotate the know to change memory channels.

Thank You,

Ed,

I thin you are correct about #21. By accident I did a complete reset, but will re-enter the frequencies into memory, and try #21.

Thanks

David

OK.. That did it! I now can use the memory.
This is a very cool rig.

I purchased it from solid Radio about a week ago, and I have already received great audio reports from it. It's the best $105.00 I ever spent in ham radio.

Thanks for the help,

David

In his message, Steve said he bought the Comm port cable (with DB9 connector) so I assumed he is not using a USB adaptor so no driver needed. The USB drivers are available off the Wouxun web site if he does need them. I use a Kenwood compatible cable that I bought some time ago from China. It works fine with no drivers, just the programming software. This is on Windows XP Pro on my laptop and Vista on one of my desktops.
Some people have had difficulty with the connections at the radio not being pushed all the way in. It appears some are a bit tight. Mine fitted with no problem.

You can switch quickly to and from the stored memory channels by pressing
the MENU button followed by the TDR button. It appears to only show the
memory display as the channel number though.

Hi Grant (and others),

I have sent Steve a copy of the program that works for me, as well as some sample channels in a .tw file and also emphasised that you need to plug the "wouxon-issue" cable properly seated in the rig!

I noted your note below about the display switching between memory and frequency - something that was puzzling me, but I tried it and I can switch from memory channel to frequency display, but can't switch back! I had to run the config software again to get back to showing channel name!

How do you do that from the keypad??!!

Stu (G3OCR)

To get back just repeat the operation. That is MENU the TDR to go from frequency to memory and MENU then TDR to go back. Works on mine as I just tried it again to check in case I was mistaken.

Yes, confirm that, but I originally had mine displaying both primary and secondary CHANNEL NAMES, and the mode select only seems to allow Frequency or Channel NUMBER.. I can't seem to get back to channel names without reloading settings from the computer.

I'm sure I'm missing something, but that manual really is obscure!

Quite right. It only displays channel number when switching using these keys. To get back to channel names you have to go through the menu system. Press MENU and select menu number 21. You can press MENU followed by 2 and 1 to go to menu number 21 quickly (or any menu number). Then select the memory disply you want. Choose NAME to display the memory names.
Another odd quirck of the firmware.

Hi ,

I have also looked in the files section and would be interested in a .TW file for UK 2m/70cm amateur repeaters.

Someone here must have done the hard work surely..

Appreciate any help,

regards,

Derek VK2YN

A lot would depend on your location as regards the repeaters.

I have a pretty good set of frequencies for simplex plus repeaters for a band from Liverpool/Blackpool across to Leeds, plus the simplex and Raynet frequencies. If that's of interest to you (or anyone else!) then send me a mail direct (stunutt "at" gmail.com)

It probably won't help you at all for the repeaters - the ones I have programmed are for the area that I mentioned - different frequencies and the wrong CTSS tones for your region. But if you want to use that as a 'template' (simplex will obviously be the same), then email me direct and I'll copy the .tw to you.

Stu

PS - it also has the PMR446 channels - could be useful, or you could just delete them

Tnx Stu..appreciate the help

Leave it, i run a "travel rptr program on my work laptop and upload as necessary..as long as i know which repeaters i can access in those areas i can easily plug in, although i think you guys use a 1750 burst as well as CTCSS for access.

cheers,

Derek VK2YN

Hi all-

I'll be in the UK the end of May/start of June. Is there a list of repeaters online that I could look at and figure out which ones I'd like to program in to my HT? I'll be in Lincolnshire in the Boston/Lincoln areas.

Just what I was looking for Stu, cheers! I owe you a pint. Hopefully I'll have a UK callsign before I arrive this time. Would make the CQ WPX a bit easier if I don't have to add that M/ to my call this time around.

Guys I will be representing Wouxun at the Dayton Hamvention in May. Our booth is in the North Hall, Space 172. This is directly across from Tarheel Antennas and The RF Connection, if you're familiar with them. Wouxun and I are working out the details but we plan to have some radios and accessories for sale. I hope to see many of you there.

Very nice.
Hope You get the oppertunity to get some software to upgrade KG-UVD(1) radioes with new firmware as it arrives, and that You are allowed to share this with this community.

I also hope You get a step by step good (and safe) explenation how to change the freq range on this exxelent radios.

Regards

Clumpen

769. Receive-only channel? Configuration lock?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-17 18:59:56 UTC
From: David A. Behar
Topic: 764 Message: 769

Hi friends,

I am thinking about buying a few of these radios, and I have a few questions from those of you who are familir with it.

1) Is it possible to configure a channel as "receive only". E.g., perhaps a channel would be configured to monitor a police agency, and I would desire that it would be impossible to transmit on the channel.

2) Once I configure the radio with a set of channels, can the radio be set up so it is difficult for an end-user to change configuration (e.g., what frequencies are saved, CTCSS codes, etc)?

Thanks!

David (K7DB)

I'd be interested in the answer to the first question too. I've seen someone comment on using the pc software to set the TX/RX frequencies so that the radio can only transmit in ham bands and receive only out of band. It'd be nice if specific frequencies could be set to receive only though.

Using the software provided you can simply leave the transmit frequency blank/empty, and this will mean that that particular channel is recieve only, I have did exactly this on my handie with the the airband channels

I think channels entered using the software cannot be modified using the handie, maybe someone can confirm ?

Yes, I believe so, but only with the programming software where you can input/program the receive and transmit frequencies in there columns. Cannot do by radio keypad. I did this on the local PD and FD so I wouldn't accidently transmit on those, but only on the Ham bands. When you try to key up on the ones you don't want too, it just beeps at ya.
Ok, I have two different radios, the other being a FDC one and just tried it on this one, the KG-UVD1P and is true, I read the radio, it did have transmit frequency there but on this radio, I was checked which channel I was on. Using the software, I took the transmit frequency out of the transmit column on channels I didn't want to transmit on and it just beeps now on those channels I didn't want to transmit on and normal for the ham frequencies.

Hope this helps you, it should as I had asked the same question too back when I got it and liked that I could do this, but only with the software which you can get from their site. Just need the programming cable. Got mine for I think $5 plus s/h from overseas..

Love this little radio, I can monitor the local repeaters and also the local Police and Fire in case something is going on in town...

Frank

Answered most of this in the other email, but the only thing I think you can do with the keypad is to offset the transmit by a big number, but who knows if someone or something else is on that trasmit frequency, so its better to do it by software and just leave it blank and now it beeps and no chance of transmitting on them at all..

Enjoy

Frank

If you are going to try the keypad offset method, try setting the offset to a frequency outside the TX coverage of the radio. I know this works with Yaesu gear.

It is well worth the small cost of a programming cable, the software even though isn't the best makes it easier than entering numerous channels by hand with offsets, CTCSS etc.

Depends on the mode of shipment. If you paid the higher cost of DHL from Hong Kong to the USA it varies from 7 to 10 days. Using the post office (US and Hong Kong) it varies between 14 to 21 days. This is based from Hong Kong to the USA East Coast.

Agreed, that is one way to do it, but like SImon and myself stated, its worth the small amount more of money to get the programming software and cable as well. Then you just leave the transmit column slot empty. The only drag with the software is that if you have entered alpha characters for the channel names, it hold 6 characters only, and using the software, for some reason won't go all 6 and when you write back to the radio, its missing the last two characters in the display.
Really no problem, but you have to go back into the radio menu via keypad and re-enter the last 2 you had there. Pain in the asky if you have alot of channels stored. Lucky for me, I only have about 14 programmed in right now..

Good luck and enjoy

Frank

Frank,

I'm not sure why you have that problem. I can put all six letters/numbers into the program, and all six display on the rig. My main beef is that there's no non-alpha-numerics; a space would be useful (U CALL, V CALL, etc instead of UCALL and VCALL - and the U does look very similar to a V). Of course, 8 letters would have been even better!

Holidays are bound to cause problems.

I import "BaconSalt" into UK from Seattle and I placed an order 2 weeks before last Christmas (USPS "International Priority" service). My shipments normally arrive in about 10 days, but that one vanished into a 'black hole'. USPS only tracked it as far as SFO and then it disappeared - popped back up on the radar 3 weeks later 20 miles from me in UK!

(www.crazy4flavour.co.uk - if anyone's interested - several other spices too!!)

Hum, gee, maybe I didn't try to put them in on the program. I know when I read the radio into the program, its missing the last 2 characters, so maybe I assumed that it wouldn't write it. I know I have them there when I put the names in via the keypad, but they all don't show on the reading it to the program, so you could be right on that. But I do know that it doesn't read it all. Yes, I agree on the other thing, wish it could do 8 instead of 6. Most of my inputs I put a dash - in there instead.

I'll give it a retry and see if I can put them in full using the software..

Thanks
Frank

Frank,

I'm not sure why you have that problem. I can put all six letters/numbers into the program, and all six display on the rig. My main beef is that there's no non-alpha-numerics; a space would be useful (U CALL, V CALL, etc instead of UCALL and VCALL - and the U does look very similar to a V). Of course, 8 letters would have been even better!

Agreed, that is one way to do it, but like SImon and myself stated, its worth the small amount more of money to get the programming software and cable as well. Then you just leave the transmit column slot empty. The only drag with the software is that if you have entered alpha characters for the channel names, it hold 6 characters only, and using the software, for some reason won't go all 6 and when you write back to the radio, its missing the last two characters in the display.
Really no problem, but you have to go back into the radio menu via keypad and re-enter the last 2 you had there. Pain in the asky if you have alot of channels stored. Lucky for me, I only have about 14 programmed in right now..

Good luck and enjoy

Frank

I didn't know the DASH was a valid character - I've tried everything I could think of as a separator! No - Just tried it and I can't put that into the program file

Hum, I haven't tried it yet on mine, when you scroll thru the characters using the keypad, there are letter, numbers and a - and + that can be used. Thats how I did it... ex: my display shows TYG-FD , thats my towns F ire D ept.

I'm researching an electric issue I'm having here, so when I get a chance, I will try as well, but seem to recall in the software that it wouldn't do it..

I've just tried (on the computer - I can't bring my radio into the country I'm in at the moment) the + and the -, and neither work. Software version 1.04

It certainly would be useful, but I wonder, if you added the signs on the radio, would you be able to import and export them if you want to change things via the software>

I'm using the higher version software, but basically its the same. I didn't think so. Its possible doing it in the radio, then reading it to the PC, then writing it back, but like I mentioned before, every time I read the radio, its only giving the first 3 characters for some reason so its Not coming up or showing the -FD, and I think its the software doing this..it could be that the dash - is not allowed and therefor, will not show the remaining 2 characters.

Now that I think of it, you know what, I just checked, I have some 4 character ones in there and they show up, but the dash and whatever single character I had after it was also gone, so I think the reasons I have mine not showing up is because I (via the keypad) used a dash, the program will not recognize it and removes the rest of it after the dash..confirmed.

Looks like the problem is the software then, not the dash. Maybe the next rev of s/w that comes out will fix the problem.

Or maybe Bob Freeth will get around to doing FTBasic fro the Wouxon and give us a whole load more goodies!

Thats what I'm using too and didn't know someone was working on another program for this according to the other emait. that would be cool..but cannot see what other features could be added, this one had all we need, just making it a bit easier to use and be able to do do what we want would be nice...

My main beef is that there's no non-alpha-numerics; a space would be useful (U CALL, V CALL, etc instead of UCALL and VCALL - and the U does look very similar to a V). Of course, 8 letters would have been even better!

Depends on a lot of factors. My last order of 100 radios left Wouxun via FedEx and arrived at my (East Coast) door 2 days & 37 minutes later. This even included a call and FAX exchange of some customs forms when they hit Anchorage. They made it from Anchorage to NC in 24 hours. I couldn't believe how fast it was.

Which frequency range do you think is more popular for US buyers and why? Is there much demand for the 220 version? Here in the Southeast, I don't think there is but I'd appreciate your thoughts on these two questions. Off-group comments to egriffin at vnet.net. Thanks,Ed

I posted about this some weeks ago. Bob Freeth does a Memory Management for the Yaesu 857 and others, that LOOKs a bit like the Wouxon one but is FAR better. It behaves like Microsoft Excel, and you can cut/paste whole blocks of memory at a time. Much more versatile.

Unfortunately he's working on a new Yaesu model right now, but I've sent him a memory file for Wouxon and he'll take a look once he's clear of other work.

His "FTBasic MMo" is the best £10/$15 you can spend for a FT857 or similar.

(I have no financial interest!)

Thats what I'm using too and didn't know someone was working on another program for this according to the other emait. that would be cool..but cannot see what other features could be added, this one had all we need, just making it a bit easier to use and be able to do do what we want would be nice...

Using V 1.13 to program the HT and software will not accept a "-"

>
> I'm using the higher version software, but basically its the same. I didn't think so. Its possible doing it in the radio, then reading it to the PC, then writing it back, but like I mentioned before, every time I read the radio, its only giving the first 3 characters for some reason so its Not coming up or showing the -FD, and I think its the software doing this..it could be that the dash - is not allowed and therefor, will not show the remaining 2 characters.
>
> Now that I think of it, you know what, I just checked, I have some 4 character ones in there and they show up, but the dash and whatever single character I had after it was also

gone, so I think the reasons I have mine not showing up is because I (via the keypad) used a dash, the program will not recognize it and removes the rest of it after the dash..confirmed.

I have one of these radios and very happy with it considering the price.
The software is easy enough to use on Windows XP, it could do with
improvements like cut and paste etc.

Hello,

I am the US dealer for Wouxun and have radios in stock. I'd like to sell
to you especially if you are in the US. Right now I only have the KG-UVD1P
in one frequency range but have 100 units on order from Wouxun in several
ranges. Here are the prices I am selling at.

>Radio Package includes:
>1- KG-UVD1P (136-174 & 350-470) (other ranges on order)
>1- USB Programming Cable & Software
>$115
>
>Accessories Package includes:
>1- 1700 mAh Battery (extra battery)
>1- AA Battery Shell
>1- Battery Eliminator (battery shell with cigarette lighter plug)
>1- Leather Case
>1- Antenna Adapter (BNC)
$53.00

Any or all items shipped Priority Mail w/insurance for $13.00

The software is very easy to use. It is very functional but lacks the
bells and whistles that some programs have. .....but it's free.

I ordered 2 of these through 409shop, I bought the 400-470 model (that was $104 shipped) along with the standard vhf split. At the time I ordered the radios, they were out of the programming cables, so I ordered those through radioshop888.

I found the task of entering in channels via the keypad to be a little difficult at first, but after that, I hand programmed in ~20 channels in 15 minutes. Overall, i love the radios and have been using them exclusively (my ft60 and vx177 have been sitting idle).

Got the radio back from Radioshop888. Apparently they could read and write to the radio and sent it back to me. I still can't. I am officially tired of trying. I'm ready to toss it. Unless Wouxon gets a real distributor in the US its too much of a gamble even for a cheap radio. The lack of good support and a well written manual is especially frustrating. The terse replies from China are less than useless when trying to trouble shoot.

Maybe I'll just flush it.

From the 409shop to Ireland, it took about 14days...

It's a simple radio to work,I don't think I ever opened the manual.
Just program the radio using cable and software and away you go, piece of cake.. No bad audio reports, I use it in the car, a cheap dual band for the mobile.

Here's a break down of my costs to Ireland;

Total cost;

â□¬05.58 for the Car Batter Eliminator for KG-UVD1
â□¬75.86 for the WOUXUN KG-UVD1P VHF UHF / + Earpiece + Prog.Cable
â□¬16.52 for shipping
â□¬27.02 for Customs VAT

Total incl Customs â□¬124.98 or $93 US...

Would I buy another one, yes if needed.

Robbie

Before you toss it. Between a buddy and I, we have 5 Wouxuns and 2 Puxings and a number of programming cords. One of his stopped working in two of the radios but fine in the rest. The one that works with mine has a VOXDUCER sticker on the side. The difference we found by using a micrometer on the pins was there was a slight difference on the pin diameters. Not much but enough that that seems to be the problem. I think the problem was caused by an aftermarket speaker mike distorting the connectors. The problem also prevented a acoustic tube headset from transmitting, but another from a different supplier is ok.

We called this accumulating tolerances when I was working in manufacturing

In line with what Steve is saying - even with a new cable (especially if it's not a Wouxon one) there can be a mis-match with tolerances that can cause problems. On the FT857 group, I even heard of a cable (plug) causing damage to a socket on the back of the rig for a similar reason.

Have you tried a different cable? Maybe there's a Wouxon user located near to you who has a cable you can try? The "2-gang" plug assembly would be even more prone to any tolerance build-up as you have tolerances in the plug (and socket) diameters and lengths PLUS possible tolerance problems with the spacing of the two plugs.

I'm about 5000km from my Wouxon right now, but maybe someone could check out the connections between the 2 plugs and the serial 9-pin 'D' and post it. Then not only would it make diagnosing these connection problems easier, it would enable is to make up our own leads if we have difficulty.

Haven't had it long enough to use anything aftermarket! The only thing in the SPKR/MIC jack has been the programming cable.

Before you toss it. Between a buddy and I, we have 5 Wouxuns and 2 Puxings and a number of programming cords. One of his stopped working in two of the radios but fine in the rest. The one that works with mine has a VOXDUCER sticker on the side. The difference we found by using a micrometer on the pins was there was a slight difference on the pin diameters. Not much but enough that that seems to be the problem. I think the problem was caused by an aftermarket speaker mike distorting the connectors. The problem also prevented a acoustic tube headset from transmitting, but another from a different supplier is ok.

We called this accumulating tolerances when I was working in manufacturing

First of all I got my radio from the 409 shop from ebay, it came in less than 1 week via USPS! I got the radio, spare battery, case, software, cable, bnc barrel for the antenna adapter, charger,etc all for $155 shipped! I got it just less than 1 month ago! I also communicated with them prior to ordering and didn't have any trouble at all understanding them or them understanding me! The software works fine with my win xp pro. The radio works very well and easy to work with compared to some of the others out there "brand names" that cost way more. In my view if you cant operate this radio than DON'T buy one of the brand name radios as the menu set up is much more complicated! So the guy that wants to flush his radio LOL go ahead. But there are not any others out there much easier to use than this one. As far as the big secret price game LOL. Good grief. SHHH, ITS A SECRET. What a joke. Reminds me of a class full of kindergarteners bringing in a show and tell toy and this, "Hello,... I'm Mr Ed. -who only talks to Wilber- lol. A horse is a horse of course of course..... LOL.
I read the instruction book AFTER I looked the radio over and programmed it (I use a $4 serial to usb level converter) and used it. It was not hard to read and understandable. I didn't see a problem with it.
Its a good radio. Its easy to use. It programs fine. And its a inexpensive "toy" that can be had in a short time and enjoyed for a long time.......if this makes any one mad, get over it or enjoy it and laugh, as I am.... Amie

If it were any more snug it woukl be in the other side of the radio.

Those of you who can get your radio and computer to communicate.....any particular setting on the radio? Is it in a memory channel mode or in the VFO mode? Is there a menu setting that needs to be set up for communications? A button on the radio that I am missing.

BTW - I DID read the manual and am able to program the radio. The manual leaves MUCH to be desired so I won't be surprised if I missed the "hold down the X button" instruction. I know my VX3 (may not be a fair comparison) has to be set into a particular mode to communicate with the programming software. The cable DOES work fine programming my Kenwood TH-G71A.

I've had several people suggest that ONLY COM1 will work with the WOUXUN software so I have gone into the advanced settings to change it.

And yes, I have made sure that I have used the same COM address that is assigned in DEVICE MANAGER is the one I use in the programming software.

But thanks for the suggestion.

I normally plug in the cable with the radio switched off, then switch on - and transfer file - Done - No other action required on the radio.

But I do normally have to mess with the com port setting - I hardly ever get it right first time. But that's probably because I have a lappy with 4 USB ports and I can never remember which USB port I used last time, and which com number! Should be no problem if you are using a "real" com port on a 'D9' connector.

(I'm impressed that Amie could program the radio directly without even looking at the manual - the manual really stinks. But maybe Amie has the right approach! Then again, I have problems programming my FT-857 manually - much easier with the software)

Depending on my USB port that I'm plugged into, mine usually works on com4 or com5.

Com1 is usually the 'D9' socket for a real RS232 port - IF you have one.

Hello all, I got my UVD1P a couple weeks back. For the most part I've mastered the basic stuff. I programmed in a pretty active repeater in the area and keyed in. I've done this a couple times and it doesn't seem to be doing anything. It's a repeater on 443.325 with a PL of 141.3. Now I put in the CTCSS for 141.3 and still haven't had any luck. I'm in a suburban environment and the repeater is about 5 miles out. I can rx from repeaters 30 miles away but I'm not getting anything here. Is there any special way to tone out with these little buggers?

I have been sniffing the serial data sent to this with a prog HHD Software Serial Monitor and have found that
the response from the radio has an ID KG669.
This occurs with the Wouxun programming software and the Unlock software. Read only

Is there any chance someone with a KG669 can try this and post the table view from the above prog in the files section.
The prog is freely downloadable

Cheers Mike

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-21 20:38:44 UTC
From: David A. Behar
Topic: 824 Message: 832

Hi Jaster,

Of course, what you are describing should work... but I will mention some things which might be worth checking.
a.. Check that you put in a transmit PL tone -- the radio has a separate setting for PL transmit and PL receive.
b.. You might disable the PL tone on receive -- there is no need for that when you are testing. (If the radio is transmitting 141.3, then putting that in your receive channel will help eliminate you hearing non-repeater activity on the channel -- whether from another user, from intermod, or whatever.)
c.. You might listen on the input, see if you can hear anybody transmitting, and then set up a channel with the PL tone for receive, and see if the people transmitting on the input are being decoded on your radio with 141.3 -- just to confirm that the people who are getting into the repeater really are transmitting PL tone 141.3 Hz.
d.. If it is not too inconvenient, drive closer to the repeater -- which you say is just five miles away -- and see if you get better luck when you are closer to the repeater, and somewhere with a clear shot.

Hello all, I got my UVD1P a couple weeks back. For the most part I've mastered the basic stuff. I programmed in a pretty active repeater in the area and keyed in. I've done this a couple times and it doesn't seem to be doing anything. It's a repeater on 443.325 with a PL of 141.3. Now I put in the CTCSS for 141.3 and still haven't had any luck. I'm in a suburban environment and the repeater is about 5 miles out. I can rx from repeaters 30 miles away but I'm not getting anything here. Is there any special way to tone out with these little buggers?

I assume the Kenwood volume control is only a potentiometer in series
with the speaker/mic's speaker, so I would have been surprised if it
hadn't worked. The buttons would need a more sophisticated interface
with the radio to function.

Jaster

David has provided what would have been my follow-up suggestion from yesterday but I would go further in my observations regardfing the sub-audible tone.

If the repeater requires a 141.3 tone for access, then you certainly must have that set on your Wouxon on its transmit setting. Rarely though do repeaters place a CTCSS code on their transmissions. If your repeater does not, then you must not set it on your Wouxon's receiver either. If you do, your rig will sit there all day, waiting patiently for a suitably encoded signal that never comes, ignoring all those without the requisite code, including that from your repeater.

I have only had my pair of Wouxons for a few months but I have had extensive experiencve with the Quansheng radios. Those come from the factory with the tone function enabled by default. I have had a number of users query why they cant receive signals, including at least two who returned a radio to the supplier as faulty when all that was required was to disable the tone function.

I programmed one for my son yesterday afternoon and for the first time in 3 radios, hit a slight problem. Only after I removed a second usb dongle programming cable that I had inadvertently left connected was I able to get the job done. Then, as an experiment, I removed the serial programming cable from COM1 (actually COM2 in my case) and reinserted the usb dongle programmer. Worked immediately. There is a degree of self-sensing going on with the software and it seems that it doesn't like any contention, which it sees if COM1 is occupied. COM1 seems to be its favourite port and it only goes looking for another port if there is no-one home on COM1.

Well today I tried a different cable, one that goes directly to a real COM port (COM 1) and again no luck. Whoever the gentleman is that will be in Dayton repping for Wouxun, please contact me directly. I'll try to meet you on Thursday during setup.

John, I'll also contact you off-list but just to let everyone know...
I'll be inside the North Hall entrance, to the right, Booth # 172.

Yesterday I ordered 100 radios for Dayton. Everyone please
spread the word that I'll be there.

I will have all those except the 12v car charger. You realize that item must be used with the dual-slot charger? I do have a few dual-slot chargers but that's an item I've wondered if I should even order. Since the standard charger will charge a battery by itself, I don't see a real need for one. Input from owners/customers on the need for the dual-slot would be appreciated.

I have a single slot charger that came with the radio and a dual slot charger. Of the two, I find I only use the dual slot, as that allows me to charge both the radio and a spare battery at the same time, or both spare batteries after a weekend in the field.

The car charger requires either the standard single slot or the dual slot charger base.

Sorry, I was wrong about that. Because the single-slot charger has a 110v cord (not a wall wart), I had forgotten there is also a 12v jack on the back. So you can pick up a regular cigarette lighter cord from the fleamarket if I don't have any.

I'm not a USA potential customer, but depending on the rice difference, I'd buy a dual-slot rather than single. My mobile phone charger has a charging slot of the phone and one for a spare battery - much better than messing about swapping the battery in the phone just to charge the spare.

My 2 cents!

848. Sydney NSW Australia

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-24 21:05:55 UTC
From: Paul
Topic: 848 Message: 848

Hi,
does anyone have a memory file already set up for Sydney Australia for 2mt and 70cm repeaters.

heading that way soon for a few days and would like to upload them into the Wouxun.

Thanks
Paul.

Paul,

i placed on in the files section under VK2YN. It covers UHF CB 2M/70CM NSW

regards,

Derek VK2YN

Hi Derek,
Thanks did see that file, suppose I should have opened it and had a look before I asked.

Got is now so thanks.

Hi all,

I tried to download one of the .tw files but unfortunately my computer doesn't like them.

Can anyone advise me of a program that will load a .tw file and where I can get it.

Probably a stupid question but any assistance will be welcome.

regards Les VK2APE

852. Re: [Wouxun_KG-UVD1] .tw files

From: Ed Griffin
Topic: 851 Message: 852

Hi Les,

Do you mean you could not download the .tw file or that you could not open it after downloading? If you're having trouble downloading the .tw file, I could send it to you as an email attachment.

The program that opens the file is "KG-UVD1P Programming" from Wouxun. There are two versions 1.12 & 1.13. I have noticed that they are not backwards compatible. If your .tw file was saved with v1.12, then v1.13 will not even see it. At least this had been my experience. I've just uploaded version 1.12 to the Files/Software section, which may help you out.

854. New poll for Wouxun_KG-UVD1

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-26 00:09:45 UTC
From: Wouxun_KG-UVD1@yahoogroups.com
Topic: 854 Message: 854

Enter your vote today! A new poll has been created for the
Wouxun_KG-UVD1 group:

WOUXUN user Poll.
Which of the following models do you own? If multiple models please enter all that apply

o uvd1.....early model without dtmf
o uvd1p vv....136-174 & 216-280
o uvd1p u.....136-174 & 400-470
o uvd1p uu....136-174 & 420-520
o uvd1p uh.....136-174& 400-480

To vote, please visit the following web page:
http://groups.yahoo.com/group/Wouxun_KG-UVD1/surveys?id=2290867

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

855. Wouxun Model Survey

858. Repeater Operation in Frequency Mode

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-04-26 15:05:22 UTC
From: n5dgk
Topic: 858 Message: 858

Has anybody figured out how to make the radio do a split frequency tx/rx in frequency mode? The instructions are on page 43 of the manual. I've tried numerous times but still can't get it to work. I set the separate tx and rx frequencies in Bands A and B. But the "Press MENU + TDR" instruction doesn't seem to do anything.

It's easy enough using the programming software to make the rig xmit on one freq and listen on another in memory mode, but I'd like to be able to set this up without having to use the computer.

859. Shipping back to Hong Kong?

BUT, if you use a Priority Mail Flat Rate box, you do NOT get tracking data, so you cannot tell when it was delivered. I JUST went through this sending a radio back to 409SHOP, took 4 weeks by priority mail to get there, they got it back to me in 7 days.

You said the magic words "flat rate". The small Flat Rate box actually goes by USPS !st Class Air. I sent it via standard Priority Mail International which gets you tracking. Unless you send it Express Mail you will not get really good tracking anyway. The last Priority Package I sent to Hong Kong to 7 days.

So do you need to insure it? Do you fill out customs forms?

So International Express Mail is the way to go? Is it costly? I have one radio and another device to ship back together.

BEWARE!

I have a supplier in Seattle (for my business www.crazy4flavour.co.uk - plug!) who use International Priority to ship to me. My shipments usually arrive in about 10 days (to UK) but I had one, over Christmas, that took almost a month.

Tracking works as far as SFO, but then the shipment "drops into a black hole" until (usually a few days later) it reappears on the radar in the UK. In the case of my Christmas shipment, it was not visible for a couple of WEEKs and nobody at USPS or UK Mail could give me any answers.

It can be worrying!

If it will fit in a small Flat Rate box its the best bang for the buck. Take 7-10 days to get there. My last package took a week.

Insurance - Up to you. I would. Add $2 to Priority, Included to $100 with Express

Customs Forms - List as defective equipment for repair. If you use Click-N-Ship on line at the USPS sit it will walk you through the process. Otherwise you'll fill out paper forms at the post office.

Cost - 1 lb Express Mail to Hong Kong is $30, priority $25 and Priority small flat rate is $12. (These are the online paid prices. You'll pay 10% MORE at the Post Office counter)

USPS is the only way to go. UPS, DHL and other commercial carriers will charge "customs fees" to the receiver for walking a package through customs whether there is a tariff on it or not.

I ship to the Far East on a regular basis and use USPS Priority Mail exclusively. I've never had a package lost. Your mileage may vary.

So do you need to insure it? Do you fill out customs forms?

So International Express Mail is the way to go? Is it costly? I have one radio and another device to ship back together.

It appears to work the same with either cord. Both just supply power to the base. The base has all the electronics in for the charging cycle.----- Original Message -----

after connecting my radio up to program it (using version 1.05) ,with my file ready to upload to radio. this message appeared on the screen,.
"Current Frequency A out of Range"
as i pressed the upload button.
what does that mean,? i thought i knew but changing some menus did not then allow me to upload..

any help appreciated ..

Thanks

Hi Alan,

Have you found an answer to your question below , regarding Frequency Mode working with repeater. I too have had a crack at trying to get this to work, but to no avail ?

Regards .. Andrew .. VK5EX

From: dummygroup
Topic: 871 Message: 871

Hi all,
I will buy a few new handhelds and hesitates between the kg-uvd1p and the ty uvf1 (http://www.tyt888.com/en/Products/Detail.asp?ID=1973). What do you think, which one is the best radio? Can someone who possibly has experience with both recommend one?
I have a ham license and plan to use it occasionaly for ham radio but I am also planning to use it for professional use (we have a small construction business) on the frequency we have a license for and hunting (in my country some VHF frequencies are free to use for hunting).
The TYT has some extra functions that the wouxun does not have (like the scrambler function for example that might be interesting for professional use)...
Thanks!

/JM

The thing that pushed me to buy the Wouxon was the alpha display. With that many memories you need some sort of text description to remind you which frequency is which especially when you have the same frequency and a different PL tone. I am extremely happy with my radio.

Thank You,
Brian N2KGC

First your problem with the out of range message. This is caused by the frequencies that you are programming in and the ones your specific radio allows in it's range. To find out what ranges are programmed in your radio download KG-xxx unlock(Use with caution) and with the serial port connected to your radio click the read button. You will most probably notice that one of the frequencies you are trying to program is outside this range.

Your second question:

Version 1.13 was published Dec 12, 2009 version 1.05 was published I believe it was July 2009. Version 1.13 is the latest available.

This is in the manual.

Enter separate frequencies only if you intend to store to a memory channel.

Enter receive frequency and offset, not the transmit frequency itself, when you intend on working the repeater in frequency mode.

Can someone help, I hope? My display on my KG-UVD1P shows all sorts of weird characters. I took it to our club meeting tonight and all the elmers said it needs a "hard reset", since you can't read the menu to do a reset that way. They said normally you press a key or two or three when you turn a HT on. Does anyone know how to do this? My computer reafds from the radio fine, so I agree with thr elmers that it just needs reset. Please, someone give me a clue how to do this!

Once you have it running, the software is "clunky", but quite easy.

There are a few little "niggles" with the radio (like the S-Meter is hopeless; anything that breaks the squelch shows S(++!!) and a few people have had problems connecting the computer to the radio, or finding the right software (if you have a problem of this sort then I can send you the program that I am using, and it works with XP-Pro)

The manual really is poor ("Chinglish"), which doesn't help a lot, and I use mine via the software programming.

In terms of the hardware, the RX is excellent, TX is good too, and I've even spent money on a better antenna than the little flexy that it comes with but can't better it significantly even with a 19" 2m/70cm antenna. When I use it with my car's mag-mount it's just great.

I've also programmed the license-free channels just above 70cms (set for 1 watt) to communicate with the XYL on her H/T

Yaesu/Icom may be an easier product to use (and to understand the manuals!) but - overall, I have no regrets about buying mine and, for its price, the Wouxon can't be beat!

Stu (G3OCR)

Menu 29 (page 36) does the reset. After reset, the voice will be in
Chinese. Menu 9 will allow you to change it back to English.

Try doing it by the seat of your pants.
Press [MENU] + 29 + [MENU]
This will put you in the reset mode. I believe the default for this
position is "VFO Reset". So after doing the above key pressing, press the
^ button, which should put you in the "Reset All" position. Then press
[MENU] again and it should reset. So the whole sequence is:
[MENU] + 29 + [MENU] + [^] + [MENU]

Good luck. If that doesn't do it, I'll ask Wouxun for you.

Has your screen always been like this, ie. since it came out of the box, or did it just start happening one day out of the blue?

My guess is that the screen connectors are probably FUBAR and it needs to go back to Wouxun to be fixed.

Alan:

Actually, I did read your post...but understood your question to be that you couldn't work repeaters in frequency mode, not that an icon didn't appear.

My response should solve the issue of how to work a repeater in frequency mode...why an icon doesn't appear I don't know, but if you're able to work the repeater, does it really matter ?

886. Repeater Offset Display Confusion using Channel Mode

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-06 02:14:57 UTC
From: jwheatleyus
Topic: 886 Message: 886

I just received the radio today, so I am learning. I set up a repeater frequency, say 147.260, a + Offset and CTCSS 100, and then store to say Channel 1. When I switch to Channel Mode Chan 1, the display shows +- (both + and -) in the Offset position. I am not yet using software- just programming with the knobs. The radio works the repeater OK, I was just surprised by the +- display (only in Channel or CH-Freq mode).

FYI The radio looks very good and worked first call to a 20 mile distant repeater. Glad I bought it.

I noticed when I had mine that the + and - showed up in both modes, but i also programmed mostly with software but a few by the radio.

Alan,
I may have an answer for you. The wording in the instructions P 43
KG-UVD1P indicating the lock symbol will come on may be in error.
If you look at P4 of the manual, the lock symbol is undefined which to
my thinking, it is not used.

If you look at the manual for KG 699E P4 the lock symbol indicates the
scrambler state which is not available on KG-UVD1P.

Remember these are made in China-No-Rules-Apply. When you interrogate
the data transmitted between a KG-UVD1P and
a PC when programming, it identifies itself as a KG-669. So who really
knows whats inside.

The manuals I have referred to were downloaded from the Wouxun site.

Cheers Mike.

From: Patrick Farcon
Topic: 868 Message: 889

I just had the same issue and I got assistance from a fellow ham. In the programming software, click on usable function on the left hand side. Then check the frequency in the A-Frequency mode in the Current box. Most likely that frequency in that box is out of range of your HT. I adjusted it to a proper value and it all works fine now. Hope this helps!

Just picked up a kguvd1 and have a question. I got the software to work on an older XP computer and put in some frequencies I wanted to save.

Now for the question...how the heck do I get to them on the radio? I can't figure out how to get to the saved frequencies.

Thanks.

You need to be in a memory mode, not the VFO and then you need to have
memory name selected. if you applied an alpha tag to each frequency stored.

Bill.

I don't have problems, but I gather that the "safe" way to do it is to start with computer and radio both switched off.
Plug the cable into computer and radio (make sure the double-plug is FULLY home in the radio - it's easy to have it "almost" fully in), then switch on computer and radio
If you have a serial cable (RS232) it's straightforward, start the Wouxon program and set the com port to 1 or 2 (whichever port you are connected to.
If you have a USB cable you will need to look in Control Panel --> System --> Ports to find out which "virtual comm" you are using (or just try them in turn!)
Then, from the Wouxon software, send the data to the radio.

Be sure to "back up" the default settings of the radio FIRST by reading the existing settings from the radio to the computer and saving that file somewhere.

896. Using unlock software to add 220 band

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-10 17:18:08 UTC
From: steve_ve6vs
Topic: 896 Message: 896

I ran the unlock software to extend the range to 225 MHz. That works however when I programmed in a 220 MHz simplex the watt-meter kicked on transmit and dropped to zero. I didn't try on receive since I no longer have my service monitor. It seems obvious that the tuned circuits are limited to the designed band and although the software will take the change it won't work well. Minor excursions are probably possible but don't expect much

With the software you can program an alpha item for each channel. You are, however, limited to 5 or 6 characters in each channel

Unfortunately, the software only accepts letters A-Z and numbers. No spaces, no special characters. I believe that there is a bit more flexibility when programming from the keyboard, but I by far prefer to use the software!

Most call signs are just A-Z and numbers and stations are identified by their callsigns. I haven't found difficulty in getting that in its entirety or where not, sufficiently close to avoind any confusion. What more do you need?

The "throat mike" looks pretty neat for use while riding a motorcycle. Seems like there is a variety of styles and prices. Are the cheap ones as good as the pricey ones?

The throat mic from 409shop works great. I've used it for fire department operations while directing traffic on windy days and others say the audio is great with no wind noise. We've even tried it with air packs on in vox mode and that works great too. I bought them for use when riding snowmobiles. For the price it is a very nice product.

907. New version of the KG-UVD1P?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-12 17:44:15 UTC
From: Asdp Asq
Topic: 903 Message: 907

Hi all,
While I was surfing on Wouxun's web site today I noticed the following on their front page:

Completely New Function
1. Dual band (KG-UVD1P)

2. 8 Groups
Scrambler available

3. DTMF encoding and DTMF decoding

4. CTCSS can set discretionarily

5. 5/2 Tone and 1750Hz tone

Note quite sure, but is that just me or does it seems like Wouxun is going
to release a vew version of the UVD1P with scrambler and 2/5tone??
Anyone has any additional info?
I haven't seen it anywhere on the shops of the Hong Kong resellers...

Thanks,

JM

From how I read it, these are five new items, not five new things available on the KGUVD1P.
The first item being the KGUVD1P.
The second new item is 8 groups scrambler available on some models(not specifically the KGUVD1P) and it is an option(see specs on KG-833).

Completely New Function
1. Dual band (KG-UVD1P)

2. 8 Groups Scrambler available

3. DTMF encoding and DTMF decoding

4. CTCSS can set discretionarily

5. 5/2 Tone and 1750Hz tone

Note quite sure, but is that just me or does it seems like Wouxun is going to release a vew version of the UVD1P with scrambler and 2/5tone??
Anyone has any additional info?
I haven't seen it anywhere on the shops of the Hong Kong resellers...

Thanks,

JM

You might be right Paul, it's kind of confusing the way they put it on their web site though. I would really like to see a new model with a scrambler and 2 tone though...
I tried to contact Wouxun by mail and ask for some clarification but no answer so far. If someone has some contacts at Wouxun it would be great to know!!
I also tried to find the model with frequency range 350-470MHz supposedly available from Wouxun but can't find it available anywhere from the Hong Kong shops. Does anyone know where it can be ordered from?

/JM

Subject: Re: [Wouxun_KG-UVD1] New version of the KG-UVD1P?

From how I read it, these are five new items, not five new things available on the KGUVD1P. The first item being the KGUVD1P.
The second new item is 8 groups scrambler available on some models(not specifically the KGUVD1P) and it is an option(see specs on KG-833).

No that is one of the bad things about this unit and its scan. it will stop on any channel that has any kind of reception. Two things you can do. change the scan to TO, time out like 5 sec or something, or adjust your SQL level. I know when i am home I have mine set on like 6 and when i have it pluged in to the antenna on my truck i can drop it to like 2. just some adv from someone who went thru it too.

A further option is to turn that channel "off" via the software programing. It will leave the channel intact but skip it in the scan process.

In my own experience, the little antenna that comes with the rig is good - it may be only 7 or 8" long, but seems to work as well as on 19" long from another company!

Of course, it works even better on the mag-mounted antenna on the car roof or the fixed antenna above the shack!

I thought you could switch the transmitter to low power from the keypad.I did it once, 6 months ago, but couldn't get it to work today. As I remember you press the 4(TXP) key while transmitting and the display Shows L (instead H) on the bottom and the dashed line becomes shorter, It resets when you cycle the power. I tried reprogramming my radio with the old 1.05 software instead of the 1.13 and it still wouldn't work. Is my radio broken? or did I not remember this correctly?

While transmitting (PTT) press the TDR key. Eack press will cycle L to H to L etc...

The only drawback is that you must be transmitting to do this so give you call when you do or change during a QSO.

Good Luck!

From their page (radiogearpro):
"Your order will be shipped within 24 hours upon payment received.
We offer combine shipment. Buy more save more!"

I got them confused with: PRORADIOSHOP, or jaco3378, these guys offer nice and cheap (relative) shipping and actually honor their claim to combine shipping. Don't get the two confused like I did.

928. Altering the CTCSS tone that has been programmed by cable

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-16 11:07:19 UTC
From: andomonir
Topic: 928 Message: 928

Hi,

I thought it would be a good idea to use the repeater channel list that we have in the UK rather than program each individual repeater into my radio.

The only thing is, even though two repeaters might be on the same channel, they have different CTCSS tones to allow access. This means that I have to change them in the field without access to my laptop.

The KG-UVD1P will not allow me to change CTCSS tones that are set with the programming software unless I am in dealer mode. This is a pain entering the code every time I want to change the CTCSS! Does anyone know if there is another way?

73,

Matt de M6FNG

I used to deal direct from their website but found their despatch time was sometimes up to a week from order with little or no response to emails. Now deal with 409Shop direct from their website, despatch time within 24Hrs and they offer (for an additional charge), the option of DHL or EMS if you want it fast (3-5 Days to Australia), with full tracking.

Hi all,

I hav ordered the HT on friday midnight to 409shop.
And they despatched it on saturday.
I hav the traking details of HK postal dept and it shows that the parcel will take todays flight.

Nice service & they will respond to all you emails too promptly.

Regards,
Sourav

Subject: [Wouxun_KG-UVD1] Re: radiogearpro-- auction seller--beware

I used to deal direct from their website but found their despatch time was sometimes up to a week from order with little or no response to emails. Now deal with 409Shop direct from their website, despatch time within 24Hrs and they offer (for an additional charge), the option of DHL or EMS if you want it fast (3-5 Days to Australia), with full tracking.

There was a US vendor selling the KG-UDV1 at Dayton but as expected the price was a bit higher that what can be had via eBay. They completely sold out of stock on Friday but were taking orders for shipment later this week. It was nice to be able to look at the display models.

Also while wandering the flea-market on Saturday I spotted a VK5 who had one on his belt and he was kind enough to show it to me. He took out the battery and showed me that the chassis that the rig is built around is die-cast so it a really solidly made little radio. His comments were consistent with most that I have heard .. you definitely want the cable and software to program it, but otherwise it is an excellent little radio with an amazing price.

I am convinced, so I am going to put in my order today, likely to solidradio.

Michael VE3WMB

Yes, I found that out too when I first started using mine. I went into the menu and turned the back light off so I could scan without it being on at the same time, but is a drag if its nightime and you want to know what channel it was on when the scan locked onto a channel, thats the only drwaback on turning it off, but does save on battery... I think its ABR or something like that in the menu. I don't have my radio in front of me to see, but can be turned off for scanning purposes..

I changed the upper side button option to "Backlight" instead of what it was originally set for..

I had found that to be a pain too... When you set the button to light it stays on till you change channel or push a button. and then you have to push the button again to get the light back on. If you have to flip thru multiple channels its a pain for sure. I email the tech people at wouxun and they gave me a bs form letter thanks for input.... blah blah blah. So email to them is a waste of time basicly.

Maybe Wouxon will read this and change the code such that backlight only works on a key press or scan channel detect- like it should work.

If you are ordering a Wouxon KG-UVD1 from ANY dealer insist on a programming cable made by Wouxon. The cable sent from Radioshoppe888 for mine was not and did not work and led to much frustration and aggravation.

I brought my radio to the Wouxon booth in Dayton and am finally able to program my radio. YAAAAAAY!

Life is good.

I also learned that splits that cannot be entered manually can be programmed via software.

I tried using the Wouxun DB-9 cable with my USB to Serial cable and so far can't make it work. Good thing I had the generic Kenwood USB cable that does work. There must be some magic in the USB to Serial cable, and my laptop does not have a serial port.

Can you tell me if the modulation quality with the Kenwood mike is
better than the 'standard' Wouxun mike/speaker??
The original one sounds quite 'muffled', so I hope that the Kenwood is
better.

I have an SMC-34 and a cheap Kenwood knockoff speaker/mic from KAWA on eBay. The SMC-34 works, but the speaker is not as good as the eBay generic Kenwood. I like the Volume control but the radio volume must be all the way on and the Mic Vol is about mid way, so not much range. I have bad hearing so someone with good ears might disagree with my assessment. I paid about $30 for the SMC-34 and $7 for the eBay unit- expensive volume control.

After playing with many serial to USB "dongels" I discoverd that most will not work with a direct serial connect due to the fact that the dongels do not supply the voltage that the direct connects need to power the "conversion" electronics that the classic serial port provided, even some of the late model laptops cheated on the make up of the serial port. I have only two and they are no longer in production/sale, and they did cost a bit then.

Regards.

Ah!
Finally I can re-arrange the hodge-podge of channels on my radio to make more sense..

Hey, out of interest - if someone was to write some third-party software for programming these radios, then what features would you want that the current one doesn't offer?

i wish they would make the scan list edit from the radio, light on when using the radio not on just while it scans. but those are hardware issues. I would like to see the software be able to put a space between letters on naming a channel. copy, cut, paste, insert, delete would all be helpful.

I have the KG-UVD1P and love it. I think the only necessary accessory is the programming cable, unless you will be using it for extended periods of time, then I would also recommend a second rechargeable battery or the AA battery pack.

Hello to the group,

I bought the kguvd1p several months ago from radioshop888, but have never been able to program the radio no matter what I do. I read the recent post about having the genuine cable which seemed to work. I emailed wouxon and they wrote back stating it would be 35.00 for shipping!. Does anyone know where I could get the cable for considerably less? Thanks for your help and I am looking forward to finally using the radio.

This is the guy that had these radios at the Dayton Hamvention:

http://www.wouxun.us/

He's in the US and ships via priority mail, so the overall cost should be reasonable, and the shipping pretty fast.

I've found him pleasant to work with, and was anxious to work with someone I met face to face and would support me in the US since I'm just getting started with amateur radio.

It did appear that he was selling the real wouxun made accessories, though, rather than the off-brand cables that seem to be available widely elsewhere.

964. Fitting the Wouxon into the charger ??

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-20 05:14:58 UTC
From: Stu Nutt
Topic: 964 Message: 964

I find that sometimes my rig "drops" neatly into the charger, but other times it doesn't seem to want to go in easily. If I tilt it forward while inserting that sometimes helps - but often it then operated one of the front panel keys (like the LOCK key.

Tilting slightly back seems to be no better.

Anyone else have this problem? Better still, does anyone have the answer!

Stu

Hi,

If you look a the battery you will notice groves, and the charger has corresponding groves, if these are not lined up properly then the rig will not drop in properly.

For the fest few times i tried charging my rig it would not charge, i thought i had a lemon till i noticed i was inserting it improperly.

I have a no name cable with the two pin connection and the RJ12 as well for programming Kenwood radios. I bought it for the Kenwood TMV-71A. I find it works well with the Wouxun. Bought it from Radioshop888 about a year ago and then went back to them to buy the radio a few months ago.

Hi Chris

Ed Griffin,W4KMA, http://www.wouxun.
us/ had the programming cable at Dayton. My un-programmable radio would suddenly program! I'd gone the generic Kenwood cable route but had no luck. Make sure you try the following first.

1. Plug in the cable in a USB socket
2. With the radio turned off plug the cable into the radio. Make sure its firmly seated
3. Start the Wouxon program (v1.13 is the latest)
4. Turn on the radio.
5. Select the READ FROM RADIO button

If that doesn't work I'd contact Ed for the new cable

I'll second Adam's positive comments about Ed at wouxun.us.

I was going to buy my radio from eBay but decided instead to buy from Wouxun.US
in NC as the difference in price was negligible and if I have any issues I can ship
the radio back to Ed in the USA rather than having to mail it back to China.

I suspect that Ed has USB cables, drop him at note at info@... .

One thing that I've found with the cable that I bought from radioshop888 is that it gets hot if you leave it plugged in to the usb port. When it gets hot it stops working. The computer still recognises it, but it won't communicate to the radio. So I always plug it into the usb port. Then into the radio while it's switched off. Turn on the radio, and send the settings.

Regards,
Simon

Hello Wouxon Engineers: Here are some suggested software/firmware updates for the KG-UVD1P

1. Turn Backlight OFF during Scan. Turn backlight ON when Scan stops on active channel and then back OFF when Scan resumes.
2. Leave Scan On when Locking keyboard. Locking should leave everything as is and just inhibit changes.
3. Enable PF2 key during receiving a message. The way it works now- if you turn On the Flashlight and then begin receiving, you can't turn Off the light until carrier goes away.
4. Change Scan to stop on active channel based on Tone Squelch rather than Carrier squelch only.
5. Provide Scan Option to either stop scanning upon hitting an active channel or continue scanning after no further activity on that channel.

Just some ideas based on my personal use.

Date: 2010-05-21 05:10:57 UTC
From: idahohillbilly114
Topic: 980 Message: 980

I bought my radio and usb cable from 409 shop I was able to get the radio to program some new channels but did not have time to work with it further. So i shut off the computer and 5 hours later when i booted the system back up a tried to program the radio i received a 10 code so uninstalled the driver and reinstalled it same problem after 3 hours of fighting with it I now get This device is not configured correctly. (Code 1)

To reinstall the drivers for this device, click Reinstall Driver.

and it keeps asking for ser2pl.sys i found the file on the net and still no luck. Any info would be great Starting to pull my hair out! AHAAH!!

They are both equally as good and I have made side by side comparisons. The Quansheng TG-UV2 does not have voice mode (No big deal.) One nice thing about the TG-UV2 is that it has a VFO / MR memory recall button which to me is more in line with amateur transceivers made by the big three.

To change the subject.

Just for what it's worth.
Keep in mind should anyone want to use this in their fire department or on some other service. Commercial use of a radio transceiver must meet Type Acceptance by the FCC. The Power Amplifier and frequency can not be adjust by the end user and frequency tolerance is limited to something like .005% (Don't quote me on thi.) When you see a commercial type accepted transceivers for business band / fire and public service (even CB) they are usually CHANNALIZED and the end user can make no adjustments to the frequency or PA.

We on the other hand as licensed amateurs can build QRP rigs and do not have to file for type acceptance to use a transmitter built for use int he amateur bands. We are suppose to have enough knowledge and common sense to use a transceiver in the service it was designed for. Thus this in part is why you take an amateur radio license exam to become a licensed operator.

It should be noted that while these transceivers meet FCC emission standards and can be used in the amateur band because you as a licensed amateur has control of the frequency / power and bandwith modes. I have been reading the thread regarding a Fire Repeater?
The transceiver IS NOT TYPE ACCEPTED for commercial use. Doesn't mean it won't work out of the amateur service. But I felt compelled to throw this on to the fourm.

Seems like a remember seeing a type acceptance on this radio on one of the dealer web sites. Can recall which one it was now though.

Thank You,
Brian N2KGC

Subject: [Wouxun_KG-UVD1] Re: KG-UVD1 to TG-UV2 comparison

They are both equally as good and I have made side by side comparisons. The Quansheng TG-UV2 does not have voice mode (No big deal.) One nice thing about the TG-UV2 is that it has a VFO / MR memory recall button which to me is more in line with amateur transceivers made by the big three.

To change the subject.

Just for what it's worth.
Keep in mind should anyone want to use this in their fire department or on some other service. Commercial use of a radio transceiver must meet Type Acceptance by the FCC. The Power Amplifier and frequency can not be adjust by the end user and frequency tolerance is limited to something like .005% (Don't quote me on thi.) When you see a commercial type accepted transceivers for business band / fire and public service (even CB) they are usually CHANNALIZED and the end user can make no adjustments to the frequency or PA.

We on the other hand as licensed amateurs can build QRP rigs and do not have to file for type acceptance to use a transmitter built for use int he amateur bands. We are suppose to have enough knowledge and common sense to use a transceiver in the service it was designed for. Thus this in part is why you take an amateur radio license exam to become a licensed operator.

It should be noted that while these transceivers meet FCC emission standards and can be used in the amateur band because you as a licensed amateur has control of the frequency / power and bandwith modes. I have been reading the thread regarding a Fire Repeater?
The transceiver IS NOT TYPE ACCEPTED for commercial use. Doesn't mean it won't work out of the amateur service. But I felt compelled to throw this on to the fourm.

I thought the uvd1 was accepted for the part 90 commercial service. The radio *does* have the capability to be used ina channelized mode with no
user access to menus and field programming. All this can be enabled/disabled via the software. It can be programmed for authorized frequencies, then "locked"
so the user cannot mess with it.

On the contrary the UVD1P is FCC Part 90 Certified which means it's for commercial, industrial, and Public Safety. For amateur radio is FCC Part 97. It just happens that we use it for HAM but it's really a commercial radio.

From: steve_ve6vs
Topic: 981 Message: 989

I assume you mean you want to hear the repeater respond. Several issues.

- If your frequencies are wrong the repeater won't hear you. See below for that.

- Also if the repeater has CTCSS access you will have to program in the correct tone in the Cod CTS/DCS box

Go to the Usable Functions screen and change the A & B step frequencies to 5 KHz

http://www.ve6vs.com/wouxun.htm for a screen shot

1st - Make sure you have the "step" setting correct (12.5kHz on 2m); if not it will probably round to the nearest step.

2nd - Does the repeater need a tone-burst? I've not found a way to get the Wouxon to generate a 1750Hz tone for repeaters that still need one.

3rd - Make sure you have the correct CTCSS tone set for the repeater you are trying to access, and the correct TX/RX shift.

Thanks for the review!
One question: does the TG-UV2 have a scrambler (it is marked as optional), and if yes is it a 8 tone scrambler and can it be programmed individually for each channel?
Thanks,

/JM

All good points Carol, now back to reality.......

First the guy wants to "fire a repeater", I read that as KEY UP A REPEATER. He wants to be able to "kerchunk" a machine.

Second of all a ham who also happens to be a fireman, cop or EMS worker (present company included) and sees any of the these radios their first question is generally, "how easy is it to open up?"

So thanks for doing your due diligence but......

John Kalotai

I wondered if anyone has used the SoonTone or AnyTone radios? I noticed some on ebay that are rather cheap, but allegedly triple-band (144, 220, 440), have a USB port for programming, Li-Ion battery, and are 3-4W output - and a third the price of our Wouxun.
I can't find anything about them online though! .. they're probably terrible, but I can't help get suckered into bargains :)

cheers,
Toby

Oh, really? Damnit - the ones I was looking at didn't mention that..
but then, it's hard to tell with some of these sellers :/

The weird thing is that the one I saw (ST-628) says it has 128
channels, yet there's no display on it to say which channel you're
on.. wtf? How does that work..

As poined out by another member these things are Part 90 certified.
Very good point he made.
I WOULD THINK HOWEVER if indeed this is the case then the unit would have to be pre-programmed where the end user has it set up on their frequencies for their business and I would not be shifted off those business frequencies. Sure seems to me to be gray area for a Part 90 transceiver to have the ability to shift frequency as easily as this one does. (I'm confused) Oh well, wouldn't be the first time.

But YOU ARE ABSOLUTELY CORRECT, for years I've heard and seen this as well. A guy buys a Yaesu, Icom or Kenwood hand held and the fisrt thing they want it to do is have a band expansion done for some other service! Oh well.... such is life.

Subject: [Wouxun_KG-UVD1] Soontone /
Anytone

I wondered if anyone has used the SoonTone or AnyTone radios? I
noticed
some on ebay that are rather cheap, but allegedly triple-band
(144, 220,
440), have a USB port for programming, Li-Ion battery, and
are 3-4W output
- and a third the price of our Wouxun.
I can't find anything about them
online though! .. they're probably
terrible, but I can't help get suckered
into bargains :)

cheers,
Toby

A commercial service communications person (you would think) would have the brains to use the programming software to lock the radio down, once their
authorized frequencies were programmed. As such, the radio will be pre-programmed for thew user, by the appropriate personnel. This is a design of the radio and the software.

1008. The uvd1 on packrt?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-05-22 20:24:13 UTC
From: John
Topic: 1008 Message: 1008

This radio has VOX. As such, it has its own sound/signal based keying circuit.

I use a Rigblaster to key my Icom rig for packet. I use AGWPE for a computer/sound card based packet engine.

With this in mind, eliminate thr Rigblaster and run your cables to the appropriate jacks on the Wouxun and computer, fire up your software and theoretically, it should work.

Bear in mind, AGWPE can set up a "key up" to "transmit signal"' delay so as to compensatew for any vox delays.

Has anyone tried this yet?

Bear in mind, AGWPE is a software TNC, and then either a terminal, or APRS program runs on top of this.... yes, for the APRS folks this could work to.

When mine comes in next week, this is something I will try.

1009. Re: [Wouxun_KG-UVD1] Re: KG-UVD1 to TG-UV2 comparison

Thank you for the comparison replies.

As a gift I would like to give a ham friend of mine the TG-UV2 with a "embedded" APRS radiomodem so he can use it for both voice and GPS tracking. Has anybody taken a TG-UV2 apart to see how much unused space (if any) is available for a small printed circuit board?

My friend is a firefighter too and would like to use the radio as his personal portable two-way radio for fire radio service. I have advised him the radio does not have an FCC ID so it is not permissible to transmit on PLMRS frequencies.

They are both equally as good and I have made side by side comparisons. The Quansheng TG-UV2 does not have voice mode (No big deal.) One nice thing about the TG-UV2 is that it has a VFO / MR memory recall button which to me is more in line with amateur transceivers made by the big three.

To change the subject.

Just for what it's worth.
Keep in mind should anyone want to use this in their fire department or on some other service. Commercial use of a radio transceiver must meet Type Acceptance by the FCC. The Power Amplifier and frequency can not be adjust by the end user and frequency tolerance is

limited to something like .005% (Don't quote me on thi.) When you see a commercial type accepted transceivers for business band / fire and public service (even CB) they are usually CHANNALIZED and the end user can make no adjustments to the frequency or PA.

We on the other hand as licensed amateurs can build QRP rigs and do not have to file for type acceptance to use a transmitter built for use int he amateur bands. We are suppose to have enough knowledge and common sense to use a transceiver in the service it was designed for. Thus this in part is why you take an amateur radio license exam to become a licensed operator.

It should be noted that while these transceivers meet FCC emission standards and can be used in the amateur band because you as a licensed amateur has control of the frequency / power and bandwith modes. I have been reading the thread regarding a Fire Repeater?
The transceiver IS NOT TYPE ACCEPTED for commercial use. Doesn't mean it won't work out of the amateur service. But I felt compelled to throw this on to the fourm.

I think you will find the delays in how the vox operates not very well suited for packet where you need a reasonably short tx/rx switching time in connected mode to keep a reasonable speed packet network working. In theory it will work, in practice with a particular packet network tuned to expect a certain tx/rx switching time for the ack's, it probably won't function well.

I just got my Wouxun yesterday and have a couple suggestions myself (just from briefly playing around with the thing). These should be easy to implement, but maybe most people wouldn't think they're a big deal. Although, they would probably help a lot with better eyes-free use of the radio:

1) Have a beep tone to mark the begining of a menu or default setting; i.e. when turning the knob through the CTCSS settings, have a beep at "off". It's great that one can select options by number, for instance, memory 24 0 for no offset, 1 for plus, 2 for minus, so there's a workaround, but this addition would be helpful.

2) A double beep for dual watch (when both bands are monitored at once). So when pressing the TDR key, one beep means dual is turned off, two would mean it's turned on. Similarly, for the A/B button, one beep for A and 2 for B. Or some such similar indicator.

3) Having channel numbers read as the tuning knob is turned is great. Having an audible frequency readout in frequency mode would be superb. Maybe a short press of the lock switch? Or a long press of some other button? (I acknowledge this one might be a bit harder to implement, but it sure would be nice.)

4) Voice tags for the menu items that don't have them. Also, even better than a beep on the default or beginning option, reading of the set of a menu parameter. Again, understanding that the latter thing would be more difficult to implement.

Even if none of these are done, this seems to be a very accessible rig.

Oh, and it would be nice to have both receivers on but not have the transmitter switch to the active one. But that's not so much an accessiblity thing I guess. Just a "be careful what you're doing" thing.

Hey Chris,

First, are you sure it's on the right com port? (My USB cable set itself up on com3)

Also, you did install the USB driver software, right? You'll need that, install it before you plug in the cable.

Then, read from radio first, to get whatever's in there first. Then make all your changes, and write toradio.

If you still have trouble, I'm happy to help if I can. I've programmed mine successfully.

Hi Chris

Who did you get the radio from? I purchased the radio from Radioshop888 and the supplied cable did not work in my case either.

Make sure of the following:

1. Use the latest versin of the software v1.13. Its available in the file section of this group.
2. Plug in the cable into a USB port
3. Start the software
4. With the radio OFF, plug in the programming cable
5. Turn the radio ON
6. Don't mess with the COM port settings, just try to read from the radio. The software will find the proper COM port.

If all that does not work the cable is suspect. I was able to purchase a cable supplied by Wouxun at Dayton. You can get one from http://www.wouxun.us/ . The $20 for cable is less than the cost of shipping back to China.

Hello to the group. I cannot, for the life of me, program this radio. I received the correct cable, but when I try to change frequencies in the software, I cannot. At this point I would pay someone to program this radio. I will pay send and receive shipping and your time. I have no idea what I am doing wrong.Thanks for any suggestions.

Hello to the group,

First of all , thanks for everyone who responded, I really appreciated that.
Ed Griffin called from Wouxon US, and was able to walk me through the steps. I took about 40 minutes of his time,and Ed, I wanna really say thank you. I was resigned to having a hand held receiver, but everything works great and I have a two way transceiver. The cable from radioshop would not work, but from Ed, works like it is supposed to. Anyway, thanks again for everything.

One problem that I had, and others might have is thinking that the programming cable was defective when in fact it was not pushed into the radio all the way.

When I received my Radio, I could not get it to read, but upon closer examiniation, I found that the two prong plug was not pushed in all the way. I would seem to click in, but when I finally pushed harder on it, It clicked again and was all the way seated, and the computer was able to talk to the radio.

Maybe this will help others out there

David

Topic: 975 Message: 1028

Hello,

my 2 cents.
1) In channel menu accessing first channels, 1-19 (in case channels 100 to 124 are programmed also) is bit clumsy, because you always have to dial 0 before the channel number e.g 0-1-3 for Ch13 otherwise if you dial 1-3 the program assumes automatically that you want to access some of the upper channels 110 to 119 for example (although there can not be bigger channel number than 124). But its not like that for channels with first digit bigger than 1 , it does not require for example to dial 0-4-5 and that shifting between 2 digit and 3 digit channel format in my mind is a bit annoying.
Better option would be that it automatically accepts the 2 digit info if no third digit entry occurs in a certain time frame.

2) Manually programmable scan limits (channel or vfo) would be useful as the scanning speed is not too high. But on the other hand this rig is not a scanner by its nature.

3) Ergonomics, not a software issue, but probably sw engineer could pass it on to some hw engineer :)

Keyboard layout could follow more conventional layout, with symbols
* 0 # at the bottom row (like mobile phones do) and not at right column. That would make it easier to dial first 0 if needed and leave the left column conveniently free for Menu, UP, DN and EXIT buttons. It seems logical for me to press the upper button to change channel up and lower button to change cahnnel down, instead of left/right for up/down. But may be this layout is logical in Asia. Still for US/EU market version the first choice could be more user-friendly.

Still, all this said not for whining and complaining but some personal notes I wanted to put down.

Good question...some of our members may have thoughts. In the mean time I'd ask whether you have your rig set on wide or narrow band. While generally wide band is used in normal fm broadcast band commercial operation and ham, police etc are traditionally narrow band.
I had all my repeater and simplex frequencies set to "narrow" band and several times over the satellites I would get an observation of low audio. Not wanting to open the unit up for modulation "surgery" I switched the programing to "wide" band and now routinely get "strong signal" or "good audio". An opinion of one......

You are misunderstanding the meaning for narrow and wide. Wide is for 25 khz spaced channels and narrow if for the new commercial service migration to 12.5 khz spaced channels required by the FCC. All of your ham radio channels should be set to wide. Narrow would be used on any commercial narrowband frequencies you would be using that require it.

The narrow and wide has nothing to do with FM broadcast on this radio, it does on some radios that offer scanning capabilities of all kinds of radio services. The low audio reports you are getting would be related to the narrow setting used. On narrow band channels the deviation is less so the user on a wide band channel would hear low audio from your transmission due to your lower deviation.

Thank You,
Brian N2KGC

The current use of "wide" and "narrow" causes a bit of confusion, especially to anyone who has been around FM & VHF for a while.

Wide used to mean deviation of +/- 15 kHz
Narrow used to mean deviation of +/- 5 kHz
FM broadcast has a deviation of +/- 75 kHz and is a different category.

The land mobile service went from wide to narrow in the 1950's. Amateur VHF FM went from wide to narrow in the 1960's

Current usage, unfortunately, has changed the meaning of wide to +/- 5 kHz and narrow to +/- 2.5 kHz.

Current amateur practice is +/- 5 kHz deviation which the UVD1P calls wide. Narrow is what the FCC has decreed all non-amateur VHF spectrum users such as police, fire, etc must go to in a few years. For ham use, keep your UVDIP on the wide setting. If you use your UVD1P for FRS or some MURS channels (not legal but I didn't tell you to do it <grin>) you will need to use the narrow setting.

My local county police & EMA folks use some "wide" and some "narrow" channels. The UVD1P works well on both.

Check for a CTCSS tone on your transmission. This can cause the buzzing sound. All these radios I have heard have a poor transmit audio response and lack high frequencies in the audio. Mic sensitivity is very low too but no problem as long as you talk close to the radio. For normal ham use, check the radio is set to the wide deviation mode. Narrow limits deviation to 2.5kHz which is commonly required for commercial services.

Where is the USB driver that Gareth refers to? (see below)
I have downloaded the software exe file but do not see any driver download.

Yesterday I unwrapped the package from Hong Kong and manually set up my KG-UVD1P. It works great, with excellent audio and signal strength reports. Tomorrow I want to connect via USB and start programming, but I am not sure if in fact I need to download a driver.

Thanks, Steve ZL2KE

You need to "unzip" the driver using the correct decompression utility. Search Google for the file extension of the driver, download the utility and try again. This worked for me.

Hi Brook

Any speaker mike or headset designed for use with a Kenwood HT will work.

I'm trying to get a speaker/mike for my KG-UVD1P radio from RadioShop888. The only listed Wouxun models are the KG-659, KG-679, KG-669,KG-689, KG-699, KG-801, and KG-703. Does the KG-UVD1P have the same speaker/mike connector? Has anyone used one of these speaker/mikes on a KG-UVD1P?

Thanks,

Brook Samuel

I bought one from MFJ designed for Kenwood. Works fine.

I have a Kenwood brand speaker mic and a Kawa eBay generic and both work with the KG-UVD1P. Looks like any unit with the Kenwood two pin connector will work.

When I plug in the USB cable (KG-UVD1P to PC) it shows as COM Port 19 (in Device Manager) for the "Prolific USB-to-Serial Comm Port".

The programming software only allows for COM Ports 1 to 9.

I have already downloaded and installed the driver.

If I try to change the COM Port number (for example from 19 to 4) Device Manager warns me that the new Port is in use and changing it could lead to conflict.

I tried using two other USB sockets but the COM Ports are still over 9.

BTW, I notice in Device Manager that 9 Ports are being used by "Bluetooth Serial Port), but I only use one Bluetooth device - a dongle to connect my cellphone.

What to do now?

Here's what the "read me" file sez that comes with the USB driver...

after install the usb driver,
go control panel, system, Hardware, device manager,
Ports (COM & LPT)
Port settings
Advanced
set COM port number to "COM1", not "com2, com3 etc)
after done should see
"Prolific USB-to-Serial Comm Port (COM1)"

The driver requires the use of COM 1. No mattetr what the warning is you get choose COM 1. It will work without conflict, at least it has for me!

Good Luck - Ted - K2TJr

Thanks for the replies. Problem solved! (see below)

I also have Software Version 1.13, but COM Ports 10 to 20 are grayed out and cannot be selected.

I chose one of the 9 Bluetooth COM Ports:
[Device Manager > Action > Uninstall]

Then I reassigned COM Port 18 (Wouxun USB connection) to be COM Port 8, and configured the radio software to use COM Port 8. My guess is that any COM Port can be chosen as long as you instruct the Wouxin Program which Port you have selected. If for example your computer scanner was on the COM Port you reassigned to Wouxun, I think your computer will automatically reassign a new Port for the scanner or whatever that Port was used by.

It remains to be seen if the Bluetooth-to-cellphone dongle will still connect and work (it was one of 9 COM Ports taken by Bluetooth, on COM Port 8) but I guess it will.

As long as you plug the USB cable in to the same port as when you assigned
the com port to it, you should have no problems.

Check your channel spacing settings. It looks like your VHF and UHF frequency requirements are on different spacings. (25kHz, 12.5 Khz, 5 kHz, etc - see manual or software for the spacings you can use)

The UHF frequency is a multiple of 12.5KHz so can be programmed as a valid frequency.
The VHF frequencies are not multiples of any frequency step size available so can't be programmed. You would need a step size of 2.5KHz to be able to programme those frequencies.

Hi there again Firefighter,

The channel spacing options on UHF (same options as VHF, but can VHF and UHF can be set to different options) are 5kHz, 6.25kHz, 12.5kHz, 25kHz and 50 or 100kHz (the last two being pretty much obsolete these days!)

Obviously the 6.25 and 5k options will get you the closest to what you want. I've worked out below the possible channels that can be set with both 5 and 6.25 as follows:

Desired Channel Poss with 12.5kHz Poss with 6.25KHz Poss with 5kHz
151.1525 151.150 151.150 151.150 or 151.155
154.2425 154.237.5 154.243.75 154.240 or 151.245

On 151.1525, the best you can get is 151.150 or 151.155. Both of these are 2.5kHz "off channel"
On 154.2425, the best you can get is 154.240 or 154.245. Again these are both 2.5kHz "off channel" (154.243.75 is worse)

All of the above "best" are available with the 5kHz spacing setting on UHF, but they are not "perfect" tunes.

As a practical test, I just listened to our local repeater here in UK to see how much the 2.5kHz offset makes to the received signal, and there was no noticeable drop in the reported signal strength or loss of audio quality when "off tune". (This was only on 'receive' and not 'transmit', but the effect should be very similar in both directions.) So I think that using the 5kHz spacing and the closest frequency that the rig will allow will "work" for you.

Caveats - I'm assuming you are in USA, so I'm using USA terminology, but other territories are likely to be the same or similar:-
a.. Give it a try - I think that the difference will not be noticeable to other users, but this does depend on the filter width in the stations (or repeater) that you are working with.
b.. Your audio level, both transmit and receive, may be a little low (if the Wouxon adjusts the modulation level according to the spacing) although it will still be well audible.
c.. If anyone is monitoring your signal with more sophisticated equipment (like the FCC!) your rig will be apparent as "off frequency" if analysed and the "powers that be" may request your employers (assuming that you are using the rig to transmit on your employers frequency, and not just "monitoring" for personal interest - which may be illegal in some countries) to have it re-tuned. However, a 2.5 kHz "error" would hardly be especially unusual with mobile/portable equipment subjected to knocks and bangs and large differences in ambient temperatures anyway.
d.. If you are monitoring your employers' frequency and only transmitting on rare occasions, like an emergency "shout", I think there is unlikely to be any problem.
e.. If you are JUST monitoring (assuming what you are monitoring is legal in the first place) then just "go for it".
Good luck - Let us know how you get on!

Use the Programming Software and make 'Scan Add'= ON in Channel Message page for channels you want to scan.

1070. Programming KG-UVD1P from a MAC Computer

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-01 14:16:31 UTC
From: ve3wmb
Topic: 1070 Message: 1070

I am sure that the question of "Can I program one of these Radios from my MAC?"
has already come up or will at some time in the future.

The answer is yes !

I am using Parallels Desktop (a virtualization environment) on my MacBook that allows me to run a Windows XP VM and I had absolutely no issues with programming my KG-UVD1P
with the Wouxun USB Cable and software downloaded from the Website using this setup.
In fact I would recommend Parallels to anyone with a Mac that has a need to run some Windows software as the performance is very good and the price is reasonable at about $80. You do however also need an install disk for whatever O/S you want to run (Linux works fine too). FYI this allow you to run Windows (or any other 32/64 bit OS) concurrently with Mac OS rather than setting up your Mac to Dual Boot Windows with BootCamp.

Personally I found the Wouxun Programming Software a bit crude but it works. I added the NOAA weather frequencies into memory and initially had problems with the WRITE to the Radio failing starting on the first WX Channel, with no explanation as to why. I tried
leaving the TX frequencies blank and that worked fine.

Here is a question .. to get the proper splits on Repeater frequencies I ended up explicitly
specifying both RX and TX frequencies. Is there a way to get the Programming Software to automatically figure out the TX frequency based on the offsets? It seemed a bit silly that I had to specify both (which was tedious BTW) but at least it worked. I am just wondering if there is any easier way to do this from the programming software?

Michael VE3WMB

P.S. I ended up getting my KG-UVD1P from Ed at Wouxun.US in North Carolina, as the small difference in price was worth it. In return I get support and a Warranty provided by a US Dealer, not one in China. I have had the radio less than week but so far I am very pleased with the Rig, the price and my dealings with Ed at Wouxun.US .

1072. Re: [Wouxun_KG-UVD1] Programming KG-UVD1P from a MAC Computer

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-01 15:57:47 UTC
From: Stu Nutt
Topic: 1070 Message: 1072

If "Parallels" works with Windows USB, then it must be pretty "virtual" - I would have expected some problems when using a USB port as a virtual Comm on a virtual machine! I'd suggest to anyone with a Mac (yes guys, there are some folks with those things!!!) to try that first.

The Wouxon programming software really is clunky, as you said, and if only Bob Freeth would give us a version of his FTBasicMMO for Wouxon it would be much nicer(!) but he's a busy guy, especially with the plugs I give him on the FT-857 Yahoo Group HI! But I've found it relatively easy to type in both TX and RX frequencies for "splits", and I've not tried to get it to do it automatically from the "split" column on the setup - in UK we have two different "standard" splits on 70 cm anyway.

Subject: [Wouxun_KG-UVD1] Programming KG-UVD1P from a MAC Computer

I am sure that the question of "Can I program one of these Radios from my MAC?"
has already come up or will at some time in the future.

The answer is yes !

I am using Parallels Desktop (a virtualization environment) on my MacBook that allows me to run a Windows XP VM and I had absolutely no issues with programming my KG-UVD1P
with the Wouxun USB Cable and software downloaded from the Website using this setup.
In fact I would recommend Parallels to anyone with a Mac that has a need to run some Windows software as the performance is very good and the price is reasonable at about $80. You do however also need an install disk for whatever O/S you want to run (Linux works fine too). FYI this allow you to run Windows (or any other 32/64 bit OS) concurrently with Mac OS rather than setting up your Mac to Dual Boot Windows with BootCamp.

Personally I found the Wouxun Programming Software a bit crude but it works. I added the NOAA weather frequencies into memory and initially had problems with the WRITE to the Radio failing starting on the first WX Channel, with no explanation as to why. I tried leaving the TX frequencies blank and that worked fine.

Here is a question .. to get the proper splits on Repeater frequencies I ended up explicitly
specifying both RX and TX frequencies. Is there a way to get the Programming Software to automatically figure out the TX frequency based on the offsets? It seemed a bit silly that I had to specify both (which was tedious BTW) but at least it worked. I am just wondering if there is any easier way to do this from the programming software?

The cut, copy and paste were there in the previous version. They are now in english instead of cryptic symbols. Still a very welcome fix.

I wonder, were there any other changes made? Features added?

1076. Why does "CH-001" remain all the time?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-01 20:06:16 UTC
From: zl2ke_steve
Topic: 1076 Message: 1076

During a scan, or when on a single channel, "CH-001" appears below the name of the channel. Have I missed something while programming? It does not make sense to me that "CH-001" should stay there all the time.

What I would like to appear is the name of the channel (four letters of the alphabet) with the frequency displayed below. Is this possible?

Thanks.

I'm probably being a bit dense, but I have yet to see the cut, copy and paste functions, and I'd really like to use them! I've used 1.12, 1.13, and now 1.15.

Can anyone give me a hint as to where these buttons are, or even better a screenshot? I've scoured the screen trying to find them, but no dice.

Right click on the cell and choose from the options.
Right click on the cell you want to put the data in and choose paste.
If you right click on the channel number, it will select the whole row which you can cut or copy then right click on the new channel number to paste the data.
Can't transfer the data to or from a spreadsheet though unfortunately.

If you mean that CH 001 is on the second line of the display, while the actual frequencies being scanned are on the top line, then that's normal - you have CH 001 selected as the "standby" frequency and any transmission on that will break in over anything being received on the top line.

I use it when I want to watch for a particular frequency ("priority") whilst scanning, or even just working on the frequency on the top line.

This is a very basic question: Are we limited to running the Wouxin from the battery (or car battery eliminator), or can we use the mains AC power? When I charged the battery - still connected - I assumed the unit could be used while charging but it would not power up.

BTW, I have a spare battery so I am not off the air at the moment :-)

Thanks. I just tried mine again and yes it does work while being charged. The reason it did not work before, I suspect, was that the battery was completely flat/dead; somewhere in the User Manual I seem to recall that there may be a short period of time before the charger takes over (probably only with a flat battery). In other words, I think that I did not wait long enough after first inserting the unit in the charger.

> The ever-popular Menu 21 ;-)

Your answer is cryptic to me. Yes, I know about Menu 21 and have been there again and again but I am unable to get the following:

Channel Name (on the top line)
The Frequency of the above channel (on the bottom line - or vice versa)

I have read on page 41 (of the 1P User Manual) "Setting Priority Scan Function" as I thought this is the reason "CH-001" remains all the time, but I have never set a Priority Channel and besides page 41 states that it can only be done via programming software and I cannot see anything there about a Priority.

To repeat - Is it possible to scan through channels (or to manually scroll through the channels) and have the channel name appear with the channel frequency below it?

1092. How to add a .tw file without replacing existing data?

From: Andy Blagg
Topic: 1093 Message: 1093

First of all, read from radio and save the file with an easily remembered filename - I suggest using the current date. Next, open this .tw file and make any additions or alterations and then send to radio. You will not lose any of the original settings if you don't overwrite them.

Have fun!

Sorry Steve, I didn't understand your question. My tongue-in-cheek answer was because my least liked quirk of this radio is that it always resorts back to <channel number> when changing between frequency mode and channel mode.

The answer to your question is that you can't have the top line of the display show the channel number while the bottom line shows some other information about that same channel. The upper and lower displays tune independently of each other.

You have to remember that the upper and lower display lines are more or less two separate vfo's that tune independently of each other. You switch between them with the A/B switch.

IF there was a way that BOTH upper and lower displays could be locked together.... so that rotating the tuning knob would change both at the same time, you could accomplish what you're talking about. But that can't be done.

Ed

The answer is no to your question, the second line on the display is for the second VFO not a multiple line display. You can have the channel name, channel number or frequency show on each VFO but not a combination of both. In the channel name display you will also get a smaller display of the channel number, but again that is per VFO. You can turn of the second VFO after you turn on the radio by pushing the MDR button.

> The ever-popular Menu 21 ;-)

Your answer is cryptic to me. Yes, I know about Menu 21 and have been there again and again but I am unable to get the following:

Channel Name (on the top line)
The Frequency of the above channel (on the bottom line - or vice versa)

I have read on page 41 (of the 1P User Manual) "Setting Priority Scan Function" as I thought this is the reason "CH-001" remains all the time, but I have never set a Priority Channel and besides page 41 states that it can only be done via programming software and I cannot see anything there about a Priority.

To repeat - Is it possible to scan through channels (or to manually scroll through the channels) and have the channel name appear with the channel frequency below it?

I am sure the answer is that you can't write to the radio without replacing what is already programmed. When you write to the radio, the current software configuration replaces everything in the radio. If you want to add channels, just read the radio, add what you want and write to the radio.

I have a Kenwood SMC-34 Speaker Mic (tinny sound) and a number of generic knockoffs from Kawa on eBay. None are any better than the Wouxon internal speaker. The Kawa has 'Entry Level' units for about $6 and Regular ones for about $10 and Professional for about $35. I use a radio daily working at a ski area in the winter and the $10 units are OK- not great but acceptable. If you want better quality sound, you might want to try a more expensive unit. Here is one source:
http://cgi.ebay.com/Heavy-Duty-Speaker-Mic-Kenwood-TH-TK-17-TK-21-KSPK-/150165060421?cmd=ViewItem&pt=LH_DefaultDomain_0&hash=item22f688fb45
I suspect that the problem with all of these units is the small speaker, so look for a unit with the largest size speaker. I am not sure if more money equals better sound.

My charger blinks bright red and dim red when charging.... when it is charged, if blinks green and red. I thought it would only blink durning the start of the charge cycle and stay *steady* red when done.

Battery is fine and charges.... is this an okay charger condition, or am i in trouble?

Hi all,
I don't know if there are any linux users on this group but I just wanted to let you know that I managed to get the programming software and the unlock software to work under linux (I mostly use Ubuntu but it should work on any modern distribution).
Both work just fine under wine, nice to be able to program the radio without needing a windows machine!
If there is any interest I can write some detailed instructions on how to get it working.

/JM

Thanks for the reply Andy but I cannot get the new .tw file added to the existing channels without wiping them out. What I did was the following:

First I saved the existing channels (local 2m and 70cm repeaters) as a .tw file, with the date/time as you suggested.

Secondly I opened the new .tw file (CB channels) and then "Write to Radio", but this replaced all of the original channels (2m 70cm).

To return to what I had, I opened the original .tw (2m 70cm) and 'wrote' it back. You say "You will not lose any of the original settings if you don't overwrite them." - but I cannot see an option to merge or combine different .tw files.

> First of all, read from radio and save the file with an easily remembered filename - I suggest using the current date. Next, open this .tw file and make any additions or alterations and then send to radio. You will not lose any of the original settings if you don't overwrite them.

There is no 'Merge'. You have to manually merge them. Read the radio, add what you want, and write to radio.

Thanks Brian. Now my question is answered and I know the name of the channel cannot also have it's frequency displayed at the same time.

I think you mean "TDR", not "MDR" ("pushing the MDR button". Doing this does indeed get rid of the CH-001 (or name of channel number 001) but it is replaced with "UVD1" - I will have to consult the User Manual to see what this means...

jwheatleyus - Thanks for the reply. From the "Files" section here on our Yahoo Groups there is a .tw file containing 40+ Australian CB/PRS channels, which are the same as the New Zealand PRS channels (where I live). What I would like to do is to add all of the PRS channels to my existing 2m/70cm channels but from what you say, different .tw files cannot be merged.

I guess that I will have to ask local Wouxun owners to see if anyone has all of the various frequencies entered into their units, then if they can email them to me :-)

Hiting the TDR button turns the second band on or off. The UVD1 just lets you know that you are not listening on that band.

Try this:

Open the program up twice. Have yours in one and this sample .tw in the other program. Copy and paste from one to the other.

Dear Friends,

I have seen that the KG-UVD1P comes in at least three versions and was wondering which is the wiser choice for Southern States especially NC near the Innerbanks???

KG-UVD1P 136-174 & 420-520

KG-UVD1P 136-174 & 350-470

KG-UVD1P 136-174 & 216-280

Please advise and thank you in advance for your help and assistance with this question..

> jwheatleyus - Thanks for the reply. From the "Files" section here on our Yahoo Groups there is a .tw file containing 40+ Australian CB/PRS channels, which are the same as the New Zealand PRS channels (where I live). What I would like to do is to add all of the PRS channels to my existing 2m/70cm channels but from what you say, different .tw files cannot be merged.

It would depend on what you are trying to do. I got the one that is 400-480.

Thanks,

Dear Friends,

I have seen that the KG-UVD1P comes in at least three versions and was wondering which is the wiser choice for Southern States especially NC near the Innerbanks???

KG-UVD1P 136-174 & 420-520

KG-UVD1P 136-174 & 350-470

KG-UVD1P 136-174 & 216-280

Please advise and thank you in advance for your help and assistance with this question..

Thanks Michael - that is a good idea.

Before I read your reply, I found a list of CB frequencies via Google and copy-pasted from that page. A tedious job but much better than manually entering each frequency.

Nothing is easy! I opened two copies of the Programming Software and tried to copy between them. It sort of works. If you copy a Chan Number (trying to copy the entire line) and go to the second program, the Paste doesn't work because that program did not do the copy. The Line Copy is internal to the program and doesn't use Windows clipboard. What does work- You can copy and paste individual frequencies using the Windows Right Click, but nothing else will work. If only Wouxon programmers had used the Windows clipboard!

Simon, Follow Stewart's instructions (below). You need to match the COM Port of your computer to the COM Port of the Wouxun program; either (PC or Wouxun program) can be adjusted.

--- In Wouxun_KG-UVD1@yahoogroups.com, "Stewart Webb" <spam@...> wrote:
>
> I just set mine up using XP SP3 and initially had the same issue - COM port in software was 1 higher than the adapter. I went to control panel, system properties, hardware, device manager and found the prolific adapter in the ports section - it was set to COM11 by default. Using the advanced tab I set it back to COM5 which the software indicated. Restarted PC and it connects up every time after that.

I don't know that I'll do this, but if I wanted a bracket I'd probably buy another AC charger, rip out the AC/DC converter and replace it with a 12V DC/DC converter, and cut away all the extra plastic I don't need.

The AC adaptor is the only thing I'm aware of that has a bracket that fits the radio/battery - though I'm not sure that it's a mechanically stable and strong solution.

If that didn't work, I'd probably glue a bracket onto the 12V car adaptor, but the downside is that it doesn't recharge the li-ion battery while traveling.

Hope that gives you a few ideas.

Assuming you bought it recently, it might be a warranty issue - although with no spare for either battery of charger, hard to say which. Have you tried whoever sold the equipment to you? They may have past experience of the problem.

Jaime, Are you a licensed amateur?

The Wouxon is NOT a CB rig - it is designed to use the amateur bands, or to be set up for specific licensed Private Radio users (company communications). It is ILLEGAL in every country that I know of to just roam the bands calling anyone that you hear.

I respectfully suggest that you either buy a CB rig, or investigate getting a "ham" license. If you don't know how to do that I'm sure that someone here can point you in the right direction. In most countries it's not a major problem to get at least an entry-level license (I think it's called "Novice" in USA)

1137. silly question about the programming software...

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-03 13:21:18 UTC
From: ldivinag
Topic: 1137 Message: 1137

the TX and RX columns...

let's say if the repeater info i get is "443.000 + PL 110.9," the 443.000 is what the repeater sends out (TX) and the input frequency or the RX would be 448.000

so the row data would be:

448.000, 443.000, NO, 110.9, HIGH , YES, WIDE, NO, MyRPT

right?

i'm using version 1.04 that came with my radio.

thanks.

If the repeater is transmitting ("out") on 443.000, then this is the figure that should be in the RX column for the KG-UVD1 software. I'm also using v1.04 and mine shows the RX is the first column, so you have the TX and RX frequencies the wrong way around.

Subject: [Wouxun_KG-UVD1] silly question about the programming software...

the TX and RX columns...

let's say if the repeater info i get is "443.000 + PL 110.9," the 443.000 is what the repeater sends out (TX) and the input frequency or the RX would be 448.000

so the row data would be:

448.000, 443.000, NO, 110.9, HIGH , YES, WIDE, NO, MyRPT

right?

i'm using version 1.04 that came with my radio.

thanks.

It's the one with the AC cord, not the wall wart... if that helps. It seems to work okay, just odd light combinations.

THe ANI sends DTMF tones when you key up... They say it is a "caller ID" Well.. can this radio display the ANI of another radio on its screen. I sent some DTMF tones to it on another radio, and nothing.

Has anyone played with it? Doesn't seem to be something og much use.

I would imagine its useful if you have a device that requires touch-tones to operate, like a repeater, key box or gate control.

Bear in mind that the radio seems to be designed with commercial users in mind. Not all functions translate to Ham.

From: zl2ke_steve
Topic: 937 Message: 1142

How can the upper side button be changed so that the backlight can be turned on/off? This avoids having to reset it via Menu 22. See Frank's comment below - from a post on 17 May 2010.

>
> I changed the upper side button option to "Backlight" instead of what it was originally set for..

> Frank

> Subject: Re: [Wouxun_KG-UVD1] BackLight stays ON during scan
>
> Yes, I found that out too when I first started using mine. I went into the menu and turned the back light off so I could scan without it being on at the same time, but is a drag if its nightime and you want to know what channel it was on when the scan locked onto a channel, thats the only drwaback on turning it off, but does save on battery... I think its ABR or something like that in the menu. I don't have my radio in front of me to see, but can be turned off for scanning purposes..

Is there a User's Manual online? In our Files section I see a service manual, but not a user's manual.

When searching for a specific function or word, a PDF would be quicker than flipping through paper pages.

Thanks.

There's a PDF manual, on the Wouxun site, but it's graphical representations of text, i.e. a scanned copy apparently, so it isn't actually searchable. I have a copy of it in a MS Word document that someone extracted and would be happy to see it put in the files area if no one has any objections.

[I posted this on the other list; posting here as well in case some didn't see it who might want to help]

Hi y'all,

I'm putting together a document to help orient blind hams to this radio. While a lot of it is now complete, what isn't complete is the menu choices. That is to say, I have a list of the menu options and what the choices on the menu are, but I don't have the order that the choices are presented in. Of course, you're used to just scrolling through the menus until you get the choice you want, but there's another way to operate the menus, and this is what I'm after. Here's the relevant section of what I'm putting together to explain:

Adjusting Menu Options

All menu options can be adjusted from the keypad. You can either scroll through the menu with the selector knob, with the up/down buttons, or by directly selecting the menu option you want by number. So that you can most easily keep track of where you are, I believe selecting options numerically is easiest, as there is, again, no audible indication of when the beginning or end of the menu is reached.

Likewise, menu options can be adjusted numerically. However, unlike the main menu, menu option adjustments start at 0, not at 1. For instance, selecting menu 4 (to adjust the power level), you can then press 0 for low power or 1 for high power. For offset direction (menu 24), you can select 0 for no offset, 1 for a plus offset, or 2 for a minus offset. So, as menu options below are listed, the first option is always number 0, not number 1.

So what I need, if some enterprising soul with a bunch of time on his/her hands needs a mind-numbing task, is to have a list of these options in order (i.e. 0, 1, 2, etc.) No need to fill in CTCSS and DCS, that's coming and easy enough to procure.

Here's what I have so far:

1: Step; Frequency step size
0: 5 KHz
1: 6.25 KHz
2: 10 KHz
3: 12.5 KHz
4: 25 KHz
5: 50 KHz
6: 100 KHz

2: SQL/Le; squelch level
0: Off
1-9: Squelch levels

3: Save; Battery Save
0: on

1: Off

4: TXP; Transmit Power
0: Low
1: high

5: Roger; "Roger beep", sends a tone at the beginning and/or end of transmission
0: Off
1: End of transmission
2: Beginning of transmission
3: Both Beginning and end of transmission

6: TOT; Timeout Timer

7: VOX; Voice-operated transmit

8: W/N; Wide/narrow FM bandwidth
0: Narrow
1: Wide

9: Voice; Voice Output
0: Off
1: Chinese
2: English

10: Transmit Overtime Alarm, 10 levels, 0: Off

11: Beep
0: Off
1: On

12: POnMSG; Power-On Message
0: Full
1: WELCOME
2: Battery Voltage

13: Busy Channel Lock, BCL
0: Off
1: On

14: Autolok, autolocks the keypad after 15 seconds
0: Off
1: On

15:R/CTC; CTCSS Decode (see list of CTCSS codes)
0: Off

16: T/CTC; CTCSS Encode (See List of CTCSS codes)
0: Off

17: R/DCS; DCS Decode (see list of DCS codes),
0: Off

18: T/DCS: DCS Encode , (see list of DCS codes)
0: Off

19: Scan Mode, sc/rev [Not sure of the order here]
0: To: When receiving signals, it will go on scanning without any operation within 5 seconds
1: CO: It will stop scanning when receiving signals, while go on scanning after 3 seconds of no signal.
2: SE: Will stop scanning when receiving a signal

20: pf1; Programmable function key

21: Ch/MDF/Freq; Channel name/number or frequency display

22: BAR; Backlight. on/off

23: Offset; Transmit/receive Frequency Split
(Enter five digits for the offset amount, i.e. 00600 for 600 KHz, 05000 for 5 MHz.)

24: SFTD:: Frequency Shift/Offset direction
0: Off (simplex)
1: Plus
2: Minus

25: Second, Stopwatch
0: On
1: Off

26: CHNAME: Channel Name
See manual for programming channel names.

27: Mem/Ch; Memory Channel Program
(Enter three digits for the channel number, such as 001, 057, 128)

28: Del/Ch: Delete/Erase a Channel
(Enter three digits for the channel number, such as 001, 057 128)

29: Reset VFO; Reset radio parameters

30: SCNCD: CTCSS/DCS Scan
(See manual)

Thanks,

I would like to extend the Rx range slightly: From maximum of 480 to 486 MHz. From your experience is the problem of locking the firmware only with large frequency changes?

Its a repeater controller that allows you to set up a crossband repeater. All you need is two radios and the appropriate cables. It can be turned on and off with DTMF tones. As far as range it really depends on radio power, antenna height, etc.Because of the proximity of the radios you need to use 2 different bands (144/440 for instance) otherwise you need a duplexer. The device shown on the linked page is more accurately refered to as a diplexer. It lets you use two radios on 2 different bands on one dual band antenna.

I use a similar system when I go hiking. I use the transceiver in my vehicle as a repeater and use a 440 simplex frequency to link me to my home 2m repeater.

Check for a CTCSS tone on your transmission. This can cause the buzzing sound. All these radios I have heard have a poor transmit audio response and lack high frequencies in the audio. Mic sensitivity is very low too but no problem as long as you talk close to the radio. For normal ham use, check the radio is set to the wide deviation mode. Narrow limits deviation to 2.5kHz which is commonly required for commercial services.

I tried both passwords with Ver 1,15.

Mode Change works such that a PW is required to change between Channel and Freq. You can change between Ch Number, Ch-Freq, and Name without a PW because they are all Channel related. However you cannot change from any Channel mode to Freq without a PW.
I suppose this is designed to allow the radio to be setup with specific Channels and locked so the user can't change frequencies, as required by FCC for Part 90 (Not Ham) use.

Reset PW worked for Reset ALL. Reset VFO did not require a PW.

From: zl2ke_steve
Topic: 1158 Message: 1158

Does a 2m / 70cm antenna give better results than the original antenna? (A different 'rubber duck' aerial, not a coax-fed external.) Reading through old group posts, I recall someone measured the SWR on 2m and it was 4:1.

1159. Re: [Wouxun_KG-UVD1] Is there a better antenna than the original?

Yahoo group: Wouxun_Radios (2009 — 2010)

I use a HR-603VU-BNC fom Opek, a 12 in long, very flexible whip. I use the antenna adapter from Wouxun.

As far as the SWR of the stock antenna, I would be very curious how that was measured. A friend that was writing an article for QST ran across similar measurements. He realized that the problem was he was not holding the radio. The radio/antenna combination uses the body as part of the ground plane effecting the SWR.

Does a 2m / 70cm antenna give better results than the original antenna? (A different 'rubber duck' aerial, not a coax-fed external.) Reading through old group posts, I recall someone measured the SWR on 2m and it was 4:1.

John, does your Opek antenna give better results than the stock one?

Theoretically it seems to me that a 2m + 70cm antenna would give better results than the original designed for a wider range: 136/225/350/480 MHz. However theory is one thing, practice is another.

I am also curious how the SWR was measured; one's body acting as part of the ground plane must affect how the antenna radiates.

> I use a HR-603VU-BNC fom Opek, a 12 inÂ long, very flexible whip. I use the antenna adapter from Wouxun.
>
> As far as the SWR of the stock antenna, I would be very curious how that was measured. A friend that was writing an article for QST ran across similar measurements. He realized that the problem was he was not holding the radio. The radio/antenna combination uses the body as part of the ground plane effecting the SWR.

My home repeater is 15 miles LOS from my home. I can open it with the stock antenna on high power but I am a bit marginal according to folks. I am DFQ with the longer whip, which really makes sense. The more antenna you can put up the better off you are.

On the receive side it makes a huge difference. I am in a fringe area of coverage for WX radio on 162.475. The National Weather Service goes from scratchy to 100% clear copy.

Once I actually get an appropriate adapter (either SMA to BNC or SMA gender changer), I really like this antenna a lot:

www.smileyantenna.com/product_info.php?products_id=55&osCsid=b58273e1ed2797b5a9bd5898447e5aa3

I've used this one for a couple years on my TH-F6A. While you'd think a telescoping antenna would be somewhat dangerous and uncomfortable, this one isn't at all. When collapsed, it's very short, and there's a spring in the bottom of it to help absorb the force of a violent encounter. It's also very lightweight, and short enough collapsed that it's not at all uncomfortable on a belt. (Bycontrast, I also hve one of those really long Comet antennas, which has a huge, very stiff connector at the bottom, and I'd managed to break my SMA connector on my Kenwood HT. Twice.)

A bought a 1/4-wave 144 / combined 70cm at the last rally that I went to. Measuring on a field-strength meter, it does have a marginally better field, but hardly worth the money that I paid. The "stock" antenna Certainly performs pretty well!

I have to admit that I do get a good improvement by connecting the 5/8th mag-mount on the car, but that's a no-brainer.

And yes. your hand is definitely a part of the ground plane! There's a very noticeable increase in measured field strength when you hold it. That effect is also noticeable when you are receiving a weakish signal with the rig on the bench, and then when you pick it up the signal comes up to R5!

All in all, the convenient little "stubby" works surprisingly well.

How much? The stock antenna definitely suffers on 2 meters. On UHF it does great.

Stu, I don't think a field-strength meter would be a good indicator because imo it is the pattern of radiation that counts. For example, the difference between a 1/4 wave whip vs a 5/8 or collinear vertical (mounted on a car or with radials) is that the 1/4 wave puts a larger amount of RF upwards rather than horizontally.

In any case I guess you found that your 144/70 antenna did not *perform* as well as the Wouxun stock antenna - correct?

I understand what you mean about the radiation pattern Steve, and it was hardly a scientific test, but the fsm was a couple of meters away, roughly level with the radio, so would have been seeing a similar angle of radiation to the horizontal pattern that we are interested in for normal contacts.

In practice, yes, the bigger antenna WAS a little BETTER, both on the fsm test and in practice. But it was not that much better. I normally use the bigger flexi-whip, for the slight improvement if I have to cope with a weak signal, but in a fairly crowded situation, with contact paths that are easy, I'll certainly fit the original 6" antenna and leave the slightly more cumbersome 19" antenna in the car.

I ran extensive tests on SMA female antennas last year. The bottom line was that I was unable to find an antenna that worked well on both bands. I contacted two manufacturers and asked about a dual band whip antenna. The both said, "Forget about it!" I resorted to convenience rather than performance. I went with the Nagoya NA-666. It is nice because the whip is as thin as spaghetti. I think it runs about $12 on Ebay. It is handy when storing the radio in small compartments. The antenna nearly folds over without any issues.

When testing dual band mag-mount antennas, the winner was a 12" flexible duck made by Workman. During field strength tests, It beat the rigid metal antennas many times larger than it. It only comes in SMA male. Workman was unable to provide a female SMA version. I am waiting for a SMA F to F adapter to try the antenna on the radio. I will report the test results to the group.

Enter your vote today! A new poll has been created for the
Wouxun_KG-UVD1 group:

Have these radios replaced your other models of amateur HT

o Yes
o No
o Still Deciding
o Not a Ham (NA)

To vote, please visit the following web page:
http://groups.yahoo.com/group/Wouxun_KG-UVD1/surveys?id=2300832

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

1174. Wouxon Poll

Yahoo group: Wouxun_Radios (2009 — 2010)

From: StuN
Topic: 1174 Message: 1174

I think there could be confusion here. The question "have these radios replaced your other H/T equipment" should perhaps have an additional answer.

If the answer is that you did not have any H/T before buying the Wouxon, is the answer yes or no - you can't replace what you don't have! The alternative scenario of a "no" answer would be that the Wouxon has been added to the armament of H/T's!

(to add to the confusion, my Wouxon can sit in the shack scanning v/uhf while I use the FT-857 to monitor 6m and the "big" hf rig to look around the lower frequencies - but I admit that all the possible uses would be too complex for a simple poll!

In a way, the Wouxon has replaced a 4-channel rig that used to monitor my local repeater - that is being relocated to the car so that I don't need to haul out the 857 when I am just going out locally!)

Well.. if you had no previous handhelds, then you'd just simply ignore the poll. Sorry it is 2:30 AM.. just got off work... some things do not compute :)

John,
You are absolutely correct. I tried my rig and it works the same way. The thing that is worrisome is that you can reset the vfo with no password, and then set the rig to transmit anywhere you like! Mine happily went to 146.52 and transmitted after a vfo reset.
It seems the only way to really lock the rig is to lockout the entire keyboard.

You didn't mention if it's USB or serial, but I have been programming with a USB cable on Windows 7 to my Wouxun, Puxing and Yaesu quite successfully. The Vista/Windows 7 USB driver that's posted here in the files section should work. I have had the best luck by setting compatibility to Vista and setting it to run as administrator, load the driver first then plug in the cable and let it be detected. If that is successful, go to device manager (Control Panel, System, Device Manager), look under Ports and make sure you see something like "Prolific USB to Serial Comm Port (COM3)" If that is there and not showing any errors you should be home free. Just fire up the Wouxun software and select whatever com port is listed and program away!

73,
Mike

Usually, the original settings before factory, PW for mode switch is 000000, that is said, there is no need to input any PW to change channel mode to frequency mode.

The user can set the valid PW through keypad to do the mode switch via programming software.

On the other hand,if the rig is already set PW for mode switch, the user can read out PW via software as well.

I should have been a little more clear in my description. This is not as much a "driver" problem as it is "operator" problem. Getting the driver installed and then making sure it was installed seemed to be the problem. The difficulty I have is trying to tell him where and what to click to navigate through Control Panel and such to find things, since I'm not familiar with Win 7. Hopefully Mike's description will help. But it seems like we got to that point over the phone and only saw one com port (Com 1). I guess I need to get my hands on a Win 7 machine so I can see how it looks.
Thanks, Ed

You didn't by chance hit the LOCK button did you? (# key)
Also check out Manual, Page 21. There is an auto-lock function, menu 14.

Reset VFO or Reset ALL, Page 36 in the manual.
Menu + 2 + 9 + Menu
Press up or down arrow to select VFO. Press Menu. Press Menu
Radio will reboot and probably speak Chinese.

Press Menu + 9 + Menu
use arrows to select English
Press Menu to set.

You can also try resetting ALL instead of VFO.

1187. Re: [WOUXUN_KG-UVD1P] Programming the radio under linux

Topic: 1187 Message: 1187

Hi all,
Here comes a short tutorial on how to get the wouxun programming and unlock software to run under linux. For this example I used ubuntu but it should work on any other modern linux version. I also think it should work under Mac OSX but I haven't tested it as I do not own a Mac.

Concerning the programming cable under linux, things are much easier than for windows. No headache with drivers, the USB cable is regonized directly, just plug it in. The type the command: dmesg and you should see something that looks like this and shows that the cable has been properly detected:

```
pl2303 ttyUSB0: pl2303 converter now disconnected from ttyUSB0
pl2303 6-2:1.0: device disconnected
usb 6-2: new full speed USB device using uhci_hcd and address 3
usb 6-2: configuration #1 chosen from 1 choice
pl2303 6-2:1.0: pl2303 converter detected
usb 6-2: pl2303 converter now attached to ttyUSB0
```

The DB9 cable also works without problem but you don't get any output in dmesg when you plug it in.
The important information in the kernel messages is the device name "ttyUSBS0" which indicate the port the cable is using (this could be different on a different machine, like ttyUSBS1). We will use that later...

The wouxun software is a windows binary, so we need to install wine in order to run it. Type the following command or install the package through synaptic:

```
sudo aptitude install wine cabextract
```

By default the wine package is missing a dll (mfc42.dll) required by the wouxun software so we will need to add it. Run the following command:

```
wget http://www.kegel.com/wine/winetricks
```

and then:

```
/bin/bash winetricks mfc42
```

Finally we need to tell wine where to find the COM1 port (remember the device name you got when you plugged the cable in?). This is done by running the following command:

```
ln -s /dev/ttyUSB0 ~/.wine/dosdevices/com1
```

That's it, it's now possible to start the programs by copying it in the directory of your choice and running the command:

```
wine "KG-UVD1P 2010-05-31.exe"
```

wine "KG-UVD1-unlock.exe"

To make it easier to launch the program for a daily use, first make sure the exe file is executable:

chmod +x "KG-UVD1P 2010-05-31.exe"

Then it's possible to start it just by clicking on it from nautilus and choosing "open with wine program loader".
That's it, no need to use a windows computer to program or unlock the radio!
Enjoy!

/JM

Hi friends,

I would like to set up the radio so the only thing the end user can do is switch channels, adjust volume, etc, but not do stuff like change frequencies, offsets, narrow/wide, tone squelch, etc.

On the other hand, I would like to be able to make these changes (when computer is not easily available) by entering a password at the keyboard.

Any advice on how to do this (or come as close as possible)? Thanks!

David

Use the software to disable the MENU button. If you do this, then set the radio in memory mode, the MENU button is disabled. The radio is then locked in memory mode with no MENU function available.
The only way to enable it is to use the software.

1193. UVD1 displayed - what does this indicate?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-13 02:35:34 UTC
From: zl2ke_steve
Topic: 1193 Message: 1193

When "TDR" is pressed, the display changes to "UVD1" below the name of the selected channel. What does this indicate?

If "TDR" is pressed again, another channel name replaces "UVD1". In this mode (with two channels displayed, top and bottom), I have noticed that if the channel is occupied - if a signal is present - then I hear that person speaking ON ALL CHANNELS. At first I thought my Wouxun was at fault, being overloaded by a strong signal, but when TDR is pressed so that UVD1 is displayed, I find that other channels are free.

Does this have something to do with the Wouxun being able to receive two frequencies at one time?

I received the Smiley 270A antenna a few days ago. I have not had a really good situation to try it out. I can say that sitting in my back yard and hitting a local (Taos, NM) repeater, the Smiley appears better than the factory dongle on 2m. I will try to get someplace where the factory antenna won't work and see if the Smiley is better. It is longer (1/4 wave) so it should be better. It is about 6" closed and 22" open. It appears to be well made. More to follow.

The radio can only receive one frequency at a time. When two frequencies are displayed at the same time, the receiver rapidly switches between the two. It locks on to the first frequency to be received (it's scanning the two frequencies). If you press the TDR button, it turns the dual frequency display off, replacing the frequency with the radio's model number, UVD1 to indicate that display is no longer active.

<<The radio can only receive one frequency at a time. When two frequencies are displayed at the same time, the receiver rapidly switches between the two. It locks on to the first frequency to be received (it's scanning the two frequencies).>>

When it "locks on to the first frequency to be received" and different channels are selected (using the up/down arrows), the received signal is the only one to be heard. That is, changing the channel makes no difference. Is this normal?

Hi Ed,
If you're used to Vista there's not much of a learning curve, but if you're coming from XP a lot of things are quite different!
The first thing I would suggest is to go to control panel, and in the upper right there is a drop down labeled "View by:" Change that from the default to "Small icons" and control panel will look and act much more like you're used to :) From that point installing the driver will be very similar to XP with a few differences. Right click the installer file, go to the compatibility tab and set it to run as Vista and check the run as administrator box. Then run the installer. If you get no errors, try plugging in the cable and see if it's detected correctly. If it is you should see a new com port in control panel.

73,
Mike

>
> I should have been a little more clear in my description. This is not as much a "driver" problem as it is "operator" problem. Getting the driver installed and then making sure it was installed seemed to be the problem. The difficulty I have is trying to tell him where and what to click to navigate through Control Panel and such to find things, since I'm not familiar with Win 7. Hopefully Mike's description will help. But it seems like we got to that point over the phone and only saw one com port (Com 1). I guess I need to get my hands on a Win 7 machine so I can see how it looks.

The Vista/Windows 7 USB driver that's posted here in the files section should work. I have had the best luck by setting compatibility to Vista and setting it to run as administrator, load the driver first then plug in the cable and let it be detected. If that is successful, go to device manager (Control Panel, System, Device Manager), look under Ports and make sure you see something like "Prolific USB to Serial Comm Port (COM3)" If that is there and not showing any errors you should be home free. Just fire up the Wouxun software and select whatever com port is listed and program away!

This is normal. The radio will continue to play the active channel. Once that channel becomes inactive, then the next signal heard, from either channel will become the active channel.

1199. Printing Anomalies

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-13 18:15:30 UTC
From: DavidO
Topic: 1199 Message: 1199

Based on 5 days of exposure to this HT, I notice that the program prints three pages. The first two are Memory Channel data and it does not print anything higher than Channel 098. Data in higher numbered channels are omitted from the print-out. If you print out as a PDF file, up to Channel 100 will be captured in the PDF.
The column headings for Columns four and five (Decode and Encode, respectively)are transposed in the print-out from the headings displayed in the program itself. The print-out displays Columns four and five as Encode and Decode, respectively. In other words, what is entered into the program as an Encode Tone prints out as a Decode Tone.

1203. Locking frequencies to RX only ?

Yes. After you program the RX frequencies, delete the TX frequencies. I have done this for the NOAA Weatherband frequencies.

Thanks,

Hi Michael, thank you for your prompt reply.
I was hoping there would be an easier solution rather than having to program in all the frequencies 1st. What I am looking for is a program that would allow me to see the entire frequency range of the radio and then be able to remove the TX ability for the frequencies that were outside the ham bands.

Regards
James

If you just want the transmit frequency range limited, there's a program on the Yahoogroup files area for that.

You could try googling for the 1kg-xxx unlock as this software allows you limit or expand the tx and rx range for each band and maybe what your looking for.

The unlock software mentioned by others will do this. You can set tranmit limits within the ham bands and allow extended receive. I actualy did this to mine, although I kept the UHF receive in ham bands too.

Hello to all,

Interesting group and found myself reading thru a lot of the questions & answers posted here and found answers to 3 questions i was going to post myself.

I wonder how many of you are using these radio's for satellite coms which is what i intend to use mine for (i have the kg-uvd1p model), would like to hear a few opinions from users as to how well the wouxon operates for the sats and what antenna your using to achieve sat contacts.

John,

I had the same problem when my radio arrived.
The problem was the broken, poor quality, Chinese CHK0501 charger chip.
I replaced the PCB with this one:
http://www.elv-downloads.de/service/manuals/62118_LiPo4_km_web_um.pdf

It fits perfectly inside and works more precise and charges faster.
(The circuit is in German but the few parts needed are available in your country as well.)

Cheers,

Have used 3 versions of the KG-uvd1 for AMSAT use. As good, and in some instances slightly better, than my Yaesu VX-7r. Programed channels for most of the U/V birds are included in the file section on this site. As to antenna I have worked a few contacts with the rubber duck but most all contacts have been through the Elk log periodic handheld. While just operating for a couple years on and off we have somewhere around 75-80 grids worked along with approx 30 states (US).
Each bird is programed with 5 split channels (AO-27 & SO-50 share same frequencies) from acquisition of signal(AOS) thru 2, Mid-pass, 3 and Loss of signal (LOS). Each receive channel is 5 khz spread with the same tx frequency on all 5 channels. Numerous freeware programs out there to track the satellites, my favorite is Orbitron.
You'll enjoy the fun of working part of the world with 5 watts thru an orbiting bird up 400 miles.....can be addicting.

Thanks for your comments :)

I solved the problem by purchasing a second Radio From our friend Ed at Wouxun.us. The charger I got with the radio from him works fine.

These radios will do that :)

You program your uplink as the transmit freq, and the downlink as the receive freq. Yoou can set the uplink PL, and have no PL on receive.

I'm trying AO51, which can be worked from an HT... Haven't got a good pass yet.. I just know I DID hear AO51,,, didn't work thru it... YET

You need to add a picture of the unit, so we can see if we have one of the "bad" ones.

Mine works just fine, though. I've heard they overheat.. no such problem here. Windows 7 64 bit and all.

Thanks for your replies guys, i'm knew to sat comms and looking forward to using this radio to achieve some contacts thru the birds...contemplating homebrewing a dualband arrow antenna for the handy and currently use satscape for pass prediction which i find very good with voice prompts telling me off sats in range.

Subject: [Wouxun_KG-UVD1] Re: New Group Member

Have used 3 versions of the KG-uvd1 for AMSAT use. As good, and in some instances slightly better, than my Yaesu VX-7r. Programed channels for most of the U/V birds are included in the file section on this site. As to antenna I have worked a few contacts with the rubber duck but most all contacts have been through the Elk log periodic handheld. While just operating for a couple years on and off we have somewhere around 75-80 grids worked along with approx 30 states (US).
Each bird is programed with 5 split channels (AO-27 & SO-50 share same frequencies) from acquisition of signal(AOS) thru 2, Mid-pass, 3 and Loss of signal (LOS). Each receive channel is 5 khz spread with the same tx frequency on all 5 channels. Numerous freeware programs out there to track the satellites, my favorite is Orbitron.
You'll enjoy the fun of working part of the world with 5 watts thru an orbiting bird up 400 miles.....can be addicting.

As suggested below I downloaded Orbitron. Seems like a good program but I haven't figured out how to find any of the amatuer sats like AO-51, 27, SO-50, etc.

They don't appear on the sat list on the right of the screen.

Somethiong I shoulf know or shall I RTFM?

Thanx, Ted K2TJR

I just go to amsat.org and use the predictor there.
We'll see what happens if today's passes are close enough.

Go to the button labeled Load TLE located right below the satelitte listing....at the next box simply click on the "amateur" list and the program will download the Kepler elements for the amateur group of "birds". Once you do that you should see AO-27, AO-51, SO-50, HO-68 & SO-67 (both in process of commissioning). You then click on which of this group you want to track. You will need to set your location (lat and lon)to get accurate path predictions.
I enjoy Orbitron as I can download a couple weeks predictions, edit out those 2AM passes (smile) and print the complete listing for daily reference. An edited print out with 4 pages to the printed sheet will generally cover 10-12 days of passes.

Orbitron is good for prediction but i prefer satscape because i can be doing something else on the pc whilst satscape is working on my taskbar and be alerted by voice to any passes due. Also looking for good prediction software for a netbook running windows ce for portable use, if anybody knows of any good prediction software for the ce id appreciate you letting me know abt it.

Also if anybody knows where i can purchase a speaker mic which has the duck antenna connected to the mic for the wouxon rig then agn id appreciate you letting me know.

Check out http://www.prymestore.com/shop/catalog/spm-3100a-3100e-antenna-speaker-microphones/spm-3101e12n-antenna-mic-fits-2-pin-kenwood-relm--bk-and-hyt-tc-268368270370268s368s-side-connector.-743.html.
Not sure if antenna connection would work but the Kenwood 2 prong mic plugs work with the KG-uvd1's.

This one looks like it would work. The really short antenna is probably not as effective as the factory antenna.

If I read it right the antenna is not included opening the question of what connection is available....too good to be true is is the same SMA connection as the stock antenna.

I have not used one of these so not an expert. Looking at the picture of the antenna port is appears to be a SMA Male, same as the radio.
I use a HT daily in the winter working at a ski area and have not had any need for a mic mounted antenna. I do use a speaker mic but leave the antenna on the radio.

You are correct- that is a better deal. I bought my radio from 409 and had good service and quick shipping from Hong Kong with tracking.

This is one nice little radio! How could one not enjoy it:) I use mine when I need a little more get up and go over the VX3. The battery last a good amount of time too! Programming is a breeze. It is a lot easier to work and program than any radio I have. :) Amie N9OXO

Topic: 1233 Message: 1233

G'day all. My KG arrived yesterday ... along with a bunch of extra's (spkr/mic, battery, dual charger, serial cable, case, etc). Thanks to VK (whoever you are) for the .tw files in the groups file area, I had the 40UHF CB channels programmed and running in under 3 minutes. Brilliant!

I'm not a Ham (although a foundation licence is probably on the cards now), just needed a UHF for the Discovery, and with our channel assignemts due to change Jan'2011, buying a fixed in car radio for 6 months use was not on. This unit can be reprogrammed when the change comes without any drama's, and we'll do an in car set later when we go to 80 channels.

For $130AUD for the radio it's a no brainer. Works brilliantly. What more could you ask for ?.

It's fun to listen in on the other frequencies, and being between 2 ports, the VHF Marine frequencies in the same set as the UHF CB bands is great.

Thanks for all the info posted up so far. It made the choice of this little radio an easy one, along with the reccomendations of some folks from a Land Rover forum I participate on, who also use and hight reccomend the unit.

Just fyi ... I'm running Vista Business on the laptop. Used the serial cable. Didn't even have to assign the COM port. Just plugged the cable into the laptop & radio, started the programming software, loaded the required .tw file, turned the radio on, uploaded to the radio and job's done. Very very easy.

Regz from Down Under
Kev..

1234. KG-UD1P Programing question

I have download the software to program this from the Wouxun site (www.wouxun.com) and it is ver 1.15 dated 2010-5-29. any changel that I do not put a frequency in or if I leave out a transmit frequency it auto fills them in with 136.174.

How than can I set a receive only station and also not have to program all of the chanels.

Delete the auto filled frequency, thus leaving it blank. You will be set.

I have them blank in the software as soon as I hit the send to radio they
auto fill in with the 136.174 or if I save the file they fill in to 136.174
(Any place there is a blank freg. it fills in with 136.174)

Odd. Make sure you have downloaded the latest version. It's here in the files section. Also, make sure you fill in your frequencies in tha "channel message" section. It should work flawlessly. After the RX field, it will highlight the TX field in blue.. just delete and go on. A blank TX field inhibits the transmitter.

The ones in the file section of the group are older than the one I downloaded from www.wouxun.com that is the latest ver V1.15 it is also the latest upladed to the files section of this group. I wonder if I should try V1.12 that is the next older ver in the files section.

Well V1.15 is the ver that keeps putiing in the 136.174 frequency when I
write to the radio or save the file to disk. I am using the 9 pin serial
cable with a windows 98 lap top that I use to program all of my radios with.

Make sure you set the parameters that you want on the second tab called "useable function" in the programiming software.

If you don't it will default to whatever the low end is set at, in this case 136.174.

Worth a try. I had to change them just to get the frequencies I wanted programmed in.

Hope this make sense.

To program the radio start with a new channel page file.

Enter RX frequency it will auto enter the frequency in the TX box press del key

TX frequency should disappear program other settings for channel the go to the next channel

I use RX only channels all the time and this is how i put them in

I have download the software to program this from the Wouxun site (www.wouxun.com) and it is ver 1.15 dated 2010-5-29. any changel that I do not put a frequency in or if I leave out a transmit frequency it auto fills them in with 136.174.

How than can I set a receive only station and also not have to program all of the chanels.

Hello, I am trying to get the programing software for the new radio from the company web site, and when I try to click on the download all i get is a line where you would normally get the hand with the finger?

When I tried it at work it did work? Also tried an older computer at home an windows xp machine and same thing I got the line? Wondering if the home computers have some thing blocking the download.

The other computer has windows 7 home.

Any and all help would be great!! I did get the software from work and it did install on the windows 7 machine just waiting for radio to show up!!

Also some of the other software downloads from the Wouxoun site do let me download them? I would like to get it to work.

Thanks Rick

Hi Kev,

I've been eyeing this radio off for a while and joined the group to see
what other people thought of it, problems and solutions, etc.

I notice from your email address that you are another resident of the
Bay. I live on Wahgunyah Road. Would it be possible to take a look of
yours first hand? Who did you purchase it from? I'm tossing up between
this and other dual-banders such as the one by TYT. With the change to
the UHF CB band approaching I wasn't keen on purchasing a new Icom or
GME just now. I would also appreciate using it as a backup radio on the
boat.

Happy to converse offline if you like. I think I know Fluid Systems
around at the Taylors Beach commercial park there. Could I give you a call?

Regards,

Lee Ryman

From: Ted Seifert Jr
Topic: 1234 Message: 1258

Launch the software.

In the white column on the left are three choices...

Channel Message
Useable function
Key set

Click on useable function and make sure you check the settings there.

Looking at it again I don't think this will solve your problem. Theses setting can be uploaded once they are set but you have to be in this function for them to upload, otherwise they have no affect.

Sorry to get your hopes up.

From: Larry Worthington
Topic: 1234 Message: 1269

I have downloaded the V1.15 rom the files section here with the same results. I tryed to download the V1.12 that is in the file section and lost connection due to a power outage and than have not been able to work on trying to redownload the v 1.12 as ened up on the road for one of my jobs last night and am at a layover today without my programing computer and radio. Will be heading home shotly and be able to try again when I get home. I will also attempt to program it from another computer that I just received today that has a 9 pin serial port on it as well. (Programing computer from the estate of a silent key)

Useable function
Key set

Click on useable function and make sure you check the settings there.

Looking at it again I don't think this will solve your problem. Theses setting can be uploaded once they are set but you have to be in this function for them to upload, otherwise they have no affect.

Sorry to get your hopes up.

Ted K2TJR

Make sure you set the parameters that you want on the second tab called "useable function" in the programiming software.

If you don't it will default to whatever the low end is set at, in this case 136.174.

Worth a try. I had to change them just to get the frequencies I wanted programmed in.

Hope this make sense.

Well V1.15 is the ver that keeps putiing in the 136.174 frequency when I write to the radio or save the file to disk. I am using the 9 pin serial cable with a windows 98 lap top that I use to program all of my radios with.

The ones in the file section of the group are older than the one I downloaded from www.wouxun.com that is the latest ver V1.15 it is also the latest upladed to the files section of this group. I wonder if I should try V1.12 that is the next older ver in the files section.

I see that one is in the file secton as well so I will try that one as well
if 1.14 does not work

1273. Can You Print OK?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-17 20:51:01 UTC
From: DavidO
Topic: 1273 Message: 1273

My colleagues and I are experiencing several anomalies when trying to print from the v. 1.15 program.

In the portrait mode, the program prints channel numbers 001 through 128, inclusive, but omits everything in the Ch. # column, the TX frequency column and the Ch. Name column.

In the Landscape mode, the program prints Channels numbers 001 through 098 only. Channel numbers 99 through 128 are not included in the print-out. All columnar data is printed.

In both the portrait and landscape modes, the column headings for Decode Tone and Encode Tone are transposed in the print-out. What is entered into the program as Encode Tone data is printed as a Decode Tone and vice versa.

Is anyone else having this problem?

Respectfully,
Dave
W1WBZ

I'm not sure if it will do any good, but I've forwarded this information to the software person at Wouxun-China. Maybe if it's an easy fix they will correct it quickly.

Ed, fwiw I pointed out the print issue (limited channels, reversal of "code" and "encode") some 6 months back prior to the last 2 version revisions of the software. It took multiple emails and copies of my "print screen" before they understood the issues. At the time the response was that they would forward to their systems people to correct. Unfortunately it appears they've opted to ignore for the time being.

73, Steve

I use XP-Pro, but there has been plenty of discussion about Win 7 here and there's a lot to read in the archives.

Basically, it does!

I think we can place more faith in Bob Freeth, G4HFQ providing us a better product when he finally gets time to look at this nice little radio.

Bob can be contacted via bob.freeth@... to find out more about his impressive line up of software which is primarly for Yaesu gear.

Love the radio. With help from the group, I have solved most conundrums EXCEPT: When I attempt to retrieve my saved "Channel Message" list of frequencies, the list has a TW file extension and none of my computers will open it. When I Google "TW File", I get sent to web pages that are selling programs that I don't think I need. Help!

1284. Re: TW and RAR file extension

Same for me- Firefox won't download and Internet Explorer will. Also, note that the KG-UVD1P program is on the second page of downloads-not obvious unless you look at the entire download page.

Even though I never "fathered" a KG-UVD1 (to the best of my knowledge ;-})

Thanks!

I sure like Wouxuns. My VX-6R seldom gets used any more. The extra couple of watts on 222 make a big difference! I bought 2 from ED at Wouxun.US, and two others from HK prior to that. For less than $120 a radio (shipped) the units are a bargain!

Hi Keisha

According to my reference A1 size is

Dimensions

A1 measures 594 × 841 millimeters or 23.39 × 33.11 inch. In PostScript, its dimensions are rounded off to 1684 × 2384 points

Here in the USA we do not have printers that will print that size for home or office use, We use the standard 8 ½ inch by 11 inch in either portrait or landscape modes. I use a HP 4200 laserjet printer, an Okidata 5200, an HP cp1510 color laserjet, and a Brother HL-5280DN laser printer. A1 is used for scientific drawings and special plotting purposes. The Yahoo Group for the Wouxun members have the same problem as I do and they are most likely using the same size paper as it is a standard here.

I have copied my response to the Wouxun group as the printing problem effects all of our US users that are otherwise very pleased with the radio.

Thank you and look forward to a program that prints to US standards and not on super big printers that none of us have.

I use the standard letter size 8? x 11 paper to print on.

As I stated I have tried severalprinters, portrait and landscape

Modes, Windows XP and Windows 7Professional with the same problems.

I print fine with my Vertex,Kenwood, and Quansheng radio programs. I

Only have problems with theWouxun programs. Since I joined the Wouxun

KG-UVD Yahoo Group, I have foundthat their members have the same problem.

Also Ed of the Wouxun,us salesgroup has the same problem. Please fix

The printing part of yoursoftware for all of your clients.

Thank you.

Good day
I have purchased serial number J06-6705 and am very satisfied with it. I do have a problem with the programming software. It will not print correctly using ver: 1.12, 1.13, or ver 1.15. In portrait mode it stops at memory 100 and drops everything after. In landscape it prints all the way to the bottom but it cuts a column for the right and one from the left all the way down the page. You lose the memory number, receive memory and the name that will display on the screen.
I have used Windows XP service pack 3 and Windows 7 professional to try printing with the same failures on both.

I would greatly appreciate a fix or an updated programming software with the printing fix included.
Thank you very much.

Hi all, my first post in this group. I recenty just got my paws on one of these UVD1P`s. bought from the net, to replace my faulty yeasu vx3R, which went faulty due to over heating problems.

A few things that would make this radio, purely awsome in the software, would make this radio iconic.

Fast scanning in VF0 mode. Differnt squelch modes for RX signals are just a few.

The small niggles i would like to iron out, one is the signal meter. It virtually gives me full scale on low signals. I just think its badly adjusted. The service menu or mode, does any one know the how too?

The yeasu models have this..and set up the internal settings a lot better than factory spec.

many thanks

Go to Control Panel, System, Hardware, Device Manager, Ports (COM & LPT). Should see USB to Serial. Right click on USB-Serial and select Properties, Advanced, and see what COM Port Number is assigned.
Now run the Wouxon Program and go to Communication Port and select the port number from above.
Give this a try. There is some 'Magic' in USB COM Ports but this is a start.

Add to my last reply- Turn radio off, plug in cable, turn radio on and try to Read the radio. If it doesn't work, try again- sometimes it takes 2-3 tries to communicate with the radio. Read radio shows you what is programmed in the radio. Use the software to add what you want and Write to the radio to save it in the radio. Also Save to a File for future use.

Got my KG-UVD1P over the weekend and so far, so good. I'm a new ham with a technician license. Does anyone know if it's possible or even a good idea to attach a mag mount antenna to this unit for mobile use?

Thanks in advance,

Tim

Welcome, Tim to the hobby as well as the KG-uvd1p. Mobile use of the "KG" with an auto mag mount is perfectly fine. You might want to purchase an sma to bnc adapter to accommodate most of the mag mount bnc connectors (also an inexpensive accessory should you want to try some of the common bnc rubber ducks). Use my Kg-uvd1p regularly in mobile ops.

Probably what is meant is A3 size - This is almost the same as USA 8 1/2 x 11, but slightly narrower and slightly higher (by under half an inch in both directions). Provided that a document has top/bottom and left/right margins of sensible sizes, the "wrong" paper should make no difference at all in ability to print.

I can't imagine anyone designing a print-out that is sized for A1 - which is twice the height and twice the width of European A3!

Stu

Subject: [Wouxun_KG-UVD1] RE: RE: RE: Printing problems with the KG-UVD1P software

Hi Keisha

According to my reference A1 size is

Dimensions

A1 measures 594 × 841 millimeters or 23.39 × 33.11 inch. In PostScript, its dimensions are rounded off to 1684 × 2384 points

Here in the USA we do not have printers that will print that size for home or office use, We use the standard 8 ½ inch by 11 inch in either portrait or landscape modes. I use a HP 4200 laserjet printer, an Okidata 5200, an HP cp1510 color laserjet, and a Brother HL-5280DN laser printer. A1 is used for scientific drawings and special plotting purposes. The Yahoo Group for the Wouxun members have the same problem as I do and they are most likely using the same size paper as it is a standard here.

I have copied my response to the Wouxun group as the printing problem effects all of our US users that are otherwise very pleased with the radio.

Thank you and look forward to a program that prints to US standards and not on super big printers that none of us have.

I use the standard letter size 8? x 11 paper to print on.

As I stated I have tried severalprinters, portrait and landscape

Modes, Windows XP and Windows 7Professional with the same problems.

I print fine with my Vertex,Kenwood, and Quansheng radio programs. I

Only have problems with theWouxun programs. Since I joined the Wouxun

KG-UVD Yahoo Group, I have foundthat their members have the same problem.

Also Ed of the Wouxun,us salesgroup has the same problem. Please fix

The printing part of yoursoftware for all of your clients.

Thank you.

Good day
I have purchased serial number J06-6705 and am very satisfied with it. I do have a problem with the programming software. It will not print correctly using ver: 1.12, 1.13, or ver 1.15. In portrait mode it stops at memory 100 and drops everything after. In landscape it prints all the way to the bottom but it cuts a column for the right and one from the left all the way down the page. You lose the memory number, receive memory and the name that will display on the screen.
I have used Windows XP service pack 3 and Windows 7 professional to try printing with the same failures on both.

I would greatly appreciate a fix or an updated programming software with the printing fix included.
Thank you very much.

I use an inexpensive Nagoya ut-108 (on ebay at item #300432294491) and have been pleased. Have not tried GMRS but assume there would be some mismatch issues. Antenna opinions and endorsements are all over the place as you'll see when others weigh in with their views on this question.

From: John
Topic: 1310 Message: 1310

Has anyone written a program to export and import channel information to a CSV (comma separated values) file? Programming the radios from a list of Amateur Radio or other frequencies would be a lot more convenient if we could open such a file in a spreadsheet or editor and sort, modify, etc.

If no one has done so, would Wouxun be open to providing the format of the file so that a developer could create such a program? (Mr. Chen?)

Tim,

I've used mine with the mag-mount on my car quite a lot - obviously the range is vastly increased over the flexi antenna! In fact, for relatively short trips, I now leave my FT-857 at home (!!) and just take the Wouxon. Then when I get out of the car, I just unplug the mag-mount and fit the flex antenna back on.

The RX sensitivity appears to be on a par with my 857, but of course, the 5 watts on 2m is not as good as the 50 watts from the 857 - but it does get out, and I've been surprised at the distance it will work.

One suggestion - add a short length of THIN 50-ohm coax to the rig, and fold that down the side, secured with a rubber band. I feel that this is (mechanically) better than having a great loop of RG-58 coming up out of the socket. (or use a remote mike/earpiece).

Stu

I bought a Tram 1180 Antenna (you will need a mag mount to use it) for my car from pixmann on eBay. I also bought a VHF/UHF Slim Jim antenna from n9tax on eBay for the house. The Slim Jim is 5' long and I put it in a piece of 1" PVC pipe. Both antennas work great.

1313. Lock out dual-radio mode

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-21 19:46:13 UTC
From: David A. Behar
Topic: 694 Message: 1313

The KG-UVD1P seems to always start up in "dual-radio" mode, "monitoring" (actually scanning) the receive frequency of both "radios".

For any application where the operator only wants to monitor one frequency, the monitored second frequency is at least a distraction, and can even lead to a missed call when the secondary channel has traffic.

The dual-radio feature can be toggled with the TDR ("Toggle Dual Radio") button. However, it would be nice for some applications if the "dual radio" function can simply be disabled, e.g., if the radio is to be used by somebody who is less experienced.

Some features -- like access to the menu -- can be disabled through the programming software. However, I don't believe there is any way to disable the TDR function.

Furthermore, even if the dual-radio feature is toggled off, if the radio is turned off and on the radio always seems to restart in dual-radio mode.

Does anybody know how to configure the radio so that it starts up with the dual-radio feature disabled?

David

This won't disable TDR but might solve the problem. Put only the desired channel in the radio and disable Menu.

The radio always defaults to the tdr on state at power up the kg-699e has a software switch that will set it to off on power up I wish they would add it to the kg-uvd1p software

a quick fix is leave both receivers on the main channel when truing off the transceiver

73

Dan

 The KG-UVD1P seems to always start up in
"dual-radio" mode, "monitoring" (actually scanning) the receive frequency of
both "radios".

For any application where the operator only wants
to monitor one frequency, the monitored second frequency is at least a
distraction, and can even lead to a missed call when the secondary channel has
traffic.

The dual-radio feature can be toggled with the
TDR ("Toggle Dual Radio") button. However,
it would be nice for some applications if the "dual radio" function can simply
be disabled, e.g., if the radio is to be used by somebody who is less
experienced.

Some features -- like access to the menu -- can be
disabled through the programming software. However, I don't believe there
is any way to disable the TDR function.

Furthermore, even if the dual-radio feature is
toggled off, if the radio is turned off and on the radio always seems to restart
in dual-radio mode.

Does anybody know how to configure the radio so
that it starts up with the dual-radio feature disabled?

This message is worth BUMPING!

I just checked their web site - http://www.hamradio.co.uk/cgi-bin/sh000001.pl?REFPAGE=http%3a%2f%2fwww.hamradio.co.uk%2f&WD=wouxon&PN=Am_Handheld_Wouxun.html%23a4270#a4270 - They are offering the radio at UNDER £60! This compares well with about £65 (including UK shipping) that I paid a few months ago direct from Hong Kong!

I've promised the XYL that I'll buy her a Wouxon if she passes her Foundation License later this year - and I'll be buying it from ML&S. Essentially the same "delivered" price as from Hong Kong, quicker delivery (assuming they haven't sold out!) and local support. NO BRAINER!

Hang on - It's not quite the same radio!

Not KG-UVD1, but KG679E. Specs look pretty similar, but a few differences. I wonder?

A bit like the radio though....shows four colours but can only use one at a time, and that's the first one you push!

It's a single band radio while the KGUVD1P covers two bands.
The bands listed in the advertisement are available in the KG679. You can buy the radio with any one of those bands only. A bit misleading in the advertisement!

Ah! - MY mistake.

The KG-679E that was under £60 is a 2-METRE ONLY rig. The KG-UVD1 costs £89.99 from ML&S. That's about £25 more than the cost shipped from Hong Kong :(

Okay, you ARE going to get excellent ML&S support, and a warranty, but I suspect that most of us will still be buying ours from eBay sellers in Hong Kong. Especially if, like me, considering buying a second unit, with the "birth pains" already solved.

I had previously considered (a couple of months ago) retailing the KG-UVD from my own mail-order store in UK, but was put off by a hint from a USA retailer that the "distributor discount" given by Wouxon was not sufficient to make it worth the costs and efforts of supporting what I sold (and I try to give top-rank service to my customers and I have a 5-star feedback, which I intend to keep!).

It would appear that this suspicion about the price structure was correct - I'd guess that ML&S are paying almost as much for their supplies as single mail-order buyer is, and to be fair, they do have to add enough to cover support, warranty, stocking costs, etc. A pity that Wouxon couldn't/wouldn't give them a better price structure.

Go to Control Panel, System, Hardware, Device Manager, Ports (COM & LPT). Should see USB to Serial. Right click on USB-Serial and select Properties, Advanced, and see what COM Port Number is assigned.
Now run the Wouxon Program and go to Communication Port and select the port number from above.
Give this a try. There is some 'Magic' in USB COM Ports but this is a start.

Its likely customs/VAT fees and the cost of doing business in the UK that maybe the more likely culprits. I work for a company that sells to W&S in the UK. They receive a generous discount but still their prices drive customers to order direct from the US.

I know at first glance the martin lynch price seems high but just think what the price would be if your unfortunate and get caught importing from china and end up with a customs charge. Plus ordering from a uk company with a very good reputation you have peace of mind with after sales service should anything go wrong. Really its swings and roundabouts as to what you choose. I chose ml&s and got it next day.

Press the Read from Radio button and if successful, you will see the radio LEDs flash and the radio setup will appear in the Channel Screen. Sometimes I must turn the radio off and back on and retry the Read button a few times to get a transfer.

Just run the programming software, select the Communication Port and make sure you can read the radio. Then use the Channel screen and enter Frequencies, tones, etc. Go to the Optional Function screen and make desired changes and same for the Key screed. Then press Write to the Radio button to load the radio. Be sure to save the setup to a file for future use.

Have you looked at Control Panel to verify that the USB-Serial device is shown and what Com Port it is using?

Topic: 1299 Message: 1333

The observation that the download appears to start, and sometimes run half-way through, suggests perhaps a mechanical problem.

Many of us have observed that the "twin plug" has to be FULLY HOME in the socket, and not in the "feels home" position a couple of millimetres from pushed right in. Would it be possible that your plug is not making good contacts?

Perhaps you could try holding it "in" while downloading?

Every port I go to it stars a down load of about 3 bars then says failed connection. I have tried every port I have. I went to control pannel changed port to match program. I have unistalled program and driver and reinstalled program and driver. I plug in usb says it is connected ready to go. It went about almost have way on port 20 one time what is the prob???? Can anyone help I am stumped. I know people think what an idiot but it isnt working I have tried for 2 days!! Any help will be greatly appreciated I just get a little flustered LOL LOL

Maybe this will help determine if there could be a problem with the cable or driver. Download FindComPort from http://www.kmaantennas.com/Wouxun/USB_Cable_Drivers and run it. It should tell you exactly which com port the cable is showing up on. If it doesn't find it, you have a driver problem or a cable problem. You may want to try the Prolific driver from the same site. Also is your cable from Wouxun? I've seen Kenwood cables that will work on Kenwoods but not on Wouxuns.

Soooo many people (including myself) have been caught by that one! I suspect that the positioning of the "splash-proof cover" on the double socket is part of the reason that it appears to be plugged in when it's not fully home. (even with the "genuine Wouxon" cable)

Pity we can't make this one a "sticky"!

Stu

There are no instructions as the radio can't crossband.
It can only do one frequency at a time. It is a two band radio, not dual band which is where people get confused I think.
It can transmit on one band and receive on the other but not at the same time as required for crossband.

Programming software does this just fine... you can have either a VHF or UHF frequency as the transmit freq, and a UHF or VHF frequency as the receive freq.
It can crossband in this respect very well. It cannot transmit and receive simultaneously, as it does not have dual receivers.

I am unsure if you can do this without the software/cable though. You get a lot more features via computer programming.

In his application, it will work. You can have a VHF frequency as a transmit frequency, and a UHF freq as a receive frequency.... I do believe, you need the software and cable to do this.

My Wouxon cannot be said to have replaced any other H/T, as I didn't have one before! But it does do good work as a "mobile" when I don't want to go to the trouble of getting my FT-857 out of the shack and put in the car.

There's going to be a second one in the house soon too - my XYL is studying for her Foundation license and has informed me that she wants a KG-UVD1 as a "passing celebration" present!

She'll probably be using the 857 too, with the "low power link" connected, but she really likes the H/T. At least my TS520 is safe - "Foundations" are only allowed 10 watts and the 520 doesn't have a facility to lower the power!

How to jump start a kg-uvp1-p without a computer

Get in the right mode in menu 21

menu 2 1 menu \/ to FREQ menu exit \/=down arrow /\= up arrow

next

menu 1 menu \/ to 5.00K menu exit

menu 1 6 menu \/ or /\ to "set ctcss to the tone you want" 107.2 menu exit

next

enter 1 4 7 1 5 0

now put it in a channel

menu 2 7 menu \/ or /\ to CH-001 menu exit

enter 1 4 7 7 5 0

menu 27 menu \/ or /\ to CH-001 menu exit "for simplex skip this step"

now you have my local 147.15 repeater with 107.2 tone programed into channel 1

now put it in chfreq mode

menu 2 1 menu \/ to CH-FREQ menu exit

go to ch 1 and your there

have fun

73

Dan

No you are not. It seems software over-rules manuak settings. I fixed this by programming the same frequency in memory twice, using bith high and low power. I display using name mode so i am not confused.

Bear in mind that pressing the TDR button while transmitting only changes the setting temporarily; until, I believe, the radio is switched off. You can, of course, toggle it back the same way if you need to. If you find that you want the power settings change permanent, you will need to delete and then reprogram the memory.

1354. Foundation License (UK)

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-25 05:27:10 UTC
From: StuN
Topic: 1354 Message: 1354

I've been looking for the specific requirements for equipment to be used by a Foundation License holder (M3 or M6) in UK. It seems to be generally accepted that the power limit is 10 watts and that the equipment must be of commercial origin (or a commercial kit)

Is there any further requirement on the origin of the equipment - like "type approval"? Or is any commercially-manufactured radio permitted?

Specifically, is the KG-UVD (or, for that matter, any of Wouxon's offerings that cover the ham bands) strictly okay for a Foundation License holder to operate?

Probably a nit-picking question, but I can't find anywhere the definition of what a Foundationer is actually allowed. This has also got me wondering if equipment originally used for other frequencies (taxi etc) can be re-programmed or re-tuned for the ham bands. Can anyone point me to a definitive? (Google hasn't helped me!)

Stu (G3OCR)

It only specifies commercial equipment - there's no such thing as 'type approval' anymore - including for taxi radios.

In theory, You can use a UVD1 for a PBR/taxi radio, provided it meets the specs (and I have used one for exactly that).

Additionally, my reading of the regs makes using commercial rigs that originally covered the band, or can do so properly without modification, OK. I use a couple of FM1000s on 4m, and my gf's car also had a reprogrammed Kenwood TK-709 for 2m until recently.

Hope this helps,
Gordon MM6YET.

Thanks Gordon,

You've pretty much confirmed what I thought (the reference in the license regs leads nowhere useful!)

I'll buy the rig for the XYL as a "celebratory pass present" and we'll both enjoy having communications! (we already have that, as she has a PMR-446 and the Wouxon has that as the "standby" channel - but the Wouxon is not quite legal at 1 watt and our range is still limited!!)

Obviously the Ham Spirit lives in the Ofcom regs ;)

One question (another "nit-picker") - The regs say that she (unlicensed) can "pass messages under my call as long as I - a class A - have CONTROL of the station". How do you read that? As she has not yet registered for a Foundation Course, can she operate the PTT switch to "pass messages@? or do I have to have control of the PTT?

Amanda talked to another ham (who happened to be an instructor for a nearby course, where she MIGHT register, as it is sooner than our own club's course) and SHE used the PTT. Is this allowed, strictly? Even as I had immediate access to the power switch if need be?

Stu (G3OCR)

As a full licence holder, you can supervise anyone (licenced or not) to
operate under your supervision, using your callsign. You are responsible
for their behaviour on air, and it's you who would cop it for any
breaches of licencing conditions that the person you're supervising
committed.

That's how I was able to operate the LZ1KPP club station in Bulgaria in
May there.

I think that's as I understand it. I don't THINK that allowing someone to operate the pTT switch is allowing them to "control" the station.

Naturally I'd not allow another person to break the licensing rules. But it is not completely clear from teh license exactly what degree of "control" is allowed.

Probably a marginal issue, but looking for clarification

there just needs to be a licensee at the control point.... to grab the radio if need be,.... an unlicensed person may key the radio if a licensee is in the area to retain control. Manny field day operstions have used a call, not with the physical operstor; but with the control op. I operated with general priveleges as along as i used the COs call. i have since uograded,
btw: i am in usa.. rules may differ

1360. programming

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-25 23:47:43 UTC
From: karl_pfaff
Topic: 1242 Message: 1360

Thanks for all the advice on programming. I think my programming download was corrupted. Plus the disc did not have any Windows 7 drivers. A friend came over and had it done in about two minutes with his software program. K8QB.

1361. Great rig (plus some general comment)

Yahoo group: Wouxun_Radios (2009 — 2010)

From: brianford5mhz
Topic: 1361 Message: 1361

Hello Group.

I own a UVD1P and KG699 for 70Mhz.
I love them. (I also own a VX7R and Alinco G7 tribander).

Only fault, yeah the s-meters, but I'm not too bothered. The quality
of everything else more than makes up for a featherlight s-meter.

Just had a look at the supplied rubber duck on 2m on my mini VNA.
It's really tuned for 136Mhz it seems (when I get time I'll post
the plots) to this group.

However the S11 at 145Mhz is still at worst typically -7db and low
SWR. Z typically 70 Ohms. On air performance is as good, if not a
little better than many others. Checked it against my VX7 and Alinco
rubber ducks and can't see any difference at all. So no complaints
in reality. Well done Wouxun.

Question:

Are there any hidden menu's on these rigs that are of any use ?
I've heard about the frequency range code, but thats it.

Now I have a bit of a moan.

Why do you guys rant and moan about having to program the rig via
a PC ?

It takes 2 minutes to do these things via the rigs own keyboard.
It's childs play.

Lets be honest, most of us would probably use up about 20 memories
at the most for some local repeaters and maybe of other stuff, and
it doesn't take long to do it by hand.

The time it takes to mess about finding cable drivers, moan about them on a user group,
complain about the Windows to the FCC and ARRL
<GRIN> and finally getting your OS to see the cable plugged in, you could have programmed
the rig and everyone else's ;-)

basically, it's the same all round the world - more or less.

UK, US and Bulgaria I'm familiar with anyway.

Brian you're right on the mark. FYI to the group, QST is in the process of doing a review of the KG-UVD1P for their Product Review section. During conversation with the author, I asked about the vswr of the antenna. I was told it was 1.8:1 SWR on 146 MHz and a 1.9:1 SWR on 449.995 MHz which is not bad for an antenna its size. (The author is very neutral but reading between the lines, I think the review will be very favorable.)

As a side note on antennas, I recently participated in an outdoor racing event with my local ham club. Several groups of 2-3 in rough terrain provided information back to a central base station. My Wouxun had its stock antenna and my friend's Wouxun had a long after-market antenna. I noticed several times, when listening to reports from various groups, my reception was better than his. Unless you are very marginal into some repeater, I doubt if after-market antennas would be a big benefit. Your results may vary.....

Sounds very good to me. These are truly great little radios. And I'm certain that QST will state that fact. I have one that someone else purchased for me. And it's a Very High Quality radio. At a super price. And if the antenna is the weakest link who cares. Sounds like all HT's. Everyone should look at these if thinking of getting a HT. You'll be glad you did.

Brian you're right on the mark. FYI to the group, QST is in the process of doing a review of the KG-UVD1P for their Product Review section. During conversation with the author, I asked about the vswr of the antenna. I was told it was 1.8:1 SWR on 146 MHz and a 1.9:1 SWR on 449.995 MHz which is not bad for an antenna its size. (The author is very neutral but reading between the lines, I think the review will be very favorable.)

As a side note on antennas, I recently participated in an outdoor racing event with my local ham club. Several groups of 2-3 in rough terrain provided information back to a central base station. My Wouxun had its stock antenna and my friend's Wouxun had a long after-market antenna. I noticed several times, when listening to reports from various groups, my reception was better than his. Unless you are very marginal into some repeater, I doubt if after-market antennas would be a big benefit. Your results may vary.....

I agree entirely.

I think that "2m stock antennas" as they are often referred to only
got a bad name because all early handhelds used HELICAL mode antennas.

Whilst these provided an impedance match in a small size, and were
dirt cheap to produce, they were of course a disaster with regards
any signal getting out.

So the 1/4 wave aftermarket whips became popular, and improved greatly
the performance.

However, now take a pice of wire the smae size as a helical ducky, feed it RF via suitable matching system and you'll see the same huge
increase in radiation.

That's how Wouxun have done it, so you get as close a 1/4 wave
whip performance but in a convenient handheld package the same as the
old style helical mode rubber ducks.

Besides, these after market whips are usually pretty clumsy things.

They stick in your ribs, lack flexibiliy, break your HT antenna
connector and make you very angry ;-)

Using the supplied Wouxun rubber duck is just fine. They have the
right idea.

Most HT's no longer come with helical mode rubber ducks these days
anyway.

Distance?? At VHF that mostly depends on line-of-sight. I've sat in this upstairs room of my house (using the rubber duck) and talked simplex to a friend in his car that was (just measured it on the map) 6 miles away. Just average rolling land in between.

I feel that if you need much more than the stock antenna, you may need an outside antenna instead of another whip antenna.

Who knows if the 3.5 dB gain figure is true or not. Nagoya does make nice antennas, I sold them some time ago and never had any complaints.

I bought a Tram 1130 (number might be wrong) Dual Band Mag Mount on eBay for my SUV. It made a dramatic improvement. I can hit mountain top repeaters at 30-50 miles.

Subject: [Wouxun_KG-UVD1] Re: Rubber Ducks

I have used it on a number of frequencies- 144-147, 156, 162, 440-450,460-465, but not specifically on GRMS.

1377. LED and display questions

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-27 02:19:55 UTC
From: ve5ps@rocketmail.com
Topic: 1377 Message: 1377

Hello,
Just got one of these, so far seems good. Has anyone found a way to stop it from changing your display (name, frequency, etc) when switching from VFO to memory? Also is there a way to disable the green LED light?

Thanks

You still need a Part 95A type-acceptance.... the commercial rigs used on GMRS have that type acceptance too.. you will see multiple FCC acceptances

Topic: 1379 Message: 1381

That's nice, and with "free shipping", the price is competitive. However, for the same thing, meaning radio plus programming cable, Ed at wouxun.us is selling for a total of about $10 more (including shipping) *and* provides warranty service; these guys state on their site your warranty service is through China if you buy from them. They also are out of stock at the moment. I have a friend who just bought from Ed, and I bet you a cold cheeseburger he isn't out of stock.

Ed, jus' tryin to help ya out, brother :)

(FCC
ID:WVTWOUXUN04)
can you use it on GMSR Frequencies
It says You got to ask

95A

95.129 Station equipment.
Every station in a GMRS system
must use transmitters the FCC has certificated
for use in the GMRS. Write to
any FCC Field Office to find out if a
particular transmitter has been certificated
for the GMRS. All station equipment
in a GMRS system must comply
with the technical rules in part 95.

Many GMRS HT's meet 95 A and B but will not do repeater splits

95B

§ 95.194 (FRS Rule 4) FRS units.
(a) You may only use an FCC certified
FRS unit. (You can identify an
FCC certified FRS unit by the label
placed on it by the manufacturer.)
(b) You must not make, or have
made, any internal modification to an
FRS unit. Any internal modification
cancels the FCC certification and voids
your authority to operate the unit in
the FRS.
(c) You may not attach any antenna,
power amplifier, or other apparatus to
an FRS unit that has not been FCC certified
as part of that FRS unit. There
are no exceptions to this rule and attaching
any such apparatus to a FRS
unit cancels the FCC certification and
voids everyone’s authority to operate
the unit in the FRS.
(d) FRS units are prohibited from
transmitting data in store-and-forward
packet operation mode.

I really must do some accurate measurements when I next have the "antenna test range" functioning. I bought a "big" antenna (about 1/4-wave at 2m) at the Norbreck Rally, and I was surprised at how little performance difference it made subjectively. It's nice, flexible, naturally a little more "clumsy", but it doesn't seem to make much apparent difference into my local repeater (2 miles away and not good from the garden - with any rig!)

I certainly agree with the comment about the operator's body making the ground plane - a big difference (with either antenna) if I put the rig down on a table!

I agree entirely.

I think that "2m stock antennas" as they are often referred to only
got a bad name because all early handhelds used HELICAL mode antennas.

Whilst these provided an impedance match in a small size, and were
dirt cheap to produce, they were of course a disaster with regards
any signal getting out.

So the 1/4 wave aftermarket whips became popular, and improved greatly
the performance.

However, now take a pice of wire the smae size as a helical ducky, feed it RF via suitable matching system and you'll see the same huge
increase in radiation.

That's how Wouxun have done it, so you get as close a 1/4 wave
whip performance but in a convenient handheld package the same as the
old style helical mode rubber ducks.

Besides, these after market whips are usually pretty clumsy things.

They stick in your ribs, lack flexibiliy, break your HT antenna
connector and make you very angry ;-)

Using the supplied Wouxun rubber duck is just fine. They have the
right idea.

Most HT's no longer come with helical mode rubber ducks these days anyway.

Hello,

MENU21 set for the working mode, there are 3 options avaiable: channel, frequency+channel number, channel name.

MENU 22 Auto backlight can be set to be off.

Regards,

Only about 50% of the headaches!

It's a lot easier to program via the computer, and repeater splits are simple. I really never got 'into' programming from the keyboard but as long as you can get the computer interface working (mainly making sure the plug on the rig is really pushed home!) then using the software really is the way to go.

It would save you from carpal tunnel syndrome for one.

But seriously, the programming cable saves a lot of knob twisting, makes it MUCH easier to program odd repeater splits and split band channels (useful if you want to play with satellites). Also, setting up the scan skip list is much simpler.

The programming software is useful for several reasons if you use the radio for various activities.
You can save different configurations of frequencies and reload to the radio.
You can set channels to be scanned.
You can set a Priority scan channel.
You can make a channel Receive Only- leave Tx frequency blank.
You can change the functions of side buttons PF1 and PF2.
You can turn off the Menu Key which allows you to lock the radio to the assigned channels- ie no VFO.
There are probably other uses that I have not found.

1394. Wouxon Programming Cable and Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-06-28 13:33:15 UTC
From: JamesA
Topic: 1394 Message: 1394

Installed the software v1.15(latest). Running on a 64 bit Vista Home Premium HP laptop computer. You MUST use the driver from the Wouxun site under Vista-Windows 7 for the cable. The other driver mentioned elsewhere here did not work, it would not read from the radio. Trick is to install the driver before plugging the cable in. Then start the software, plug the cable in to the computer, then the radio, then turn the radio on.

Purchased the USB cable from Radioshop 888, same place I got the radio. Works flawlessly. Much easier with the software. I never experienced the "not fully in" the radio syndrome of the cable.

The radio works very well on 2M and 70CM repeaters. On 2M I have had someone tell me there was a slight bit of "white noise", but this is using the handheld with the stock antenna in my ground floor living room in a house with aluminum siding.

Hi folks,
Got a question I can't seem to find an answer to for a friend's KG-UVD1P...

The receive light has begun to blink intermittently. Sometimes it blinks once and then blinks several times in a row, then once again and so on. Any ideas as to what's up with this?

Thanks in advance.

If you have tone squelch enabled it could be receiving a signal with no or wrong tone. Also it could be short bursts of received signal too short to open squelch.

Yes but when you switch between VFO and the memories it resets to channel, it does not save what you had before.
Menu 21 does not disable the really bright green LED light.

Oh well, guess I'm stuck with it the way it is.

Thanks

Do you have CTCSS enabled for RX on one or other VFO?

If so, it may be recieveing somthing which doesn't match the CTCSS
frequency.

Why don't you increase the value of the series resistor to dim the LED? That would be the most sensible way.

First, turn OFF all tones and see if the Rx works. You really only require tones on the Tx side for typical repeaters.

If you still don't have program software you can manually set up a repeater. Put in Rx frequency, use Menu to get to Offset (.6Mhz for 2m and 5MHz for 70cm), put in + or - offset, use Menu to select Tx Tone, don't use Rx Tone, save setup to a Channel and you are ready. Ignore the punctuation.

Subject: [Wouxun_KG-UVD1] Searching this group...

I noticed some posts about search being broken in this group. I experienced it firsthand after trying to find out more about frequency unlocking for my new KG-UVD1P.

Since the messages are publicly available you can tell Google to do a site search which will restrict pages searched to a particular site.

I entered the following into Google's search box and got back the results I was looking for:

site:http://groups.yahoo.com/group/Wouxun_KG-UVD1/ unlock

You can do your own search by appending your search terms to the following line:

site:http://groups.yahoo.com/group/Wouxun_KG-UVD1/ [search terms here]

Hope this helps someone, the user involvement in this group has been great, being able to search might help us from recreating the wheel :)

-Dave

Topic: 1413 Message: 1413

Hi all,

I guess it's time to release this thing, even though it still needs some TLC. Anyone care to help us fill in the holes, we'd appreciate. The file is (or should be) up on the Yahoogroup files area now; it's also here:
http://dl.dropbox.com/u/1053407/kg-uvd1p-eyes-free.rtf

Please send corrections, additions, and the obviously missing things to me directly. Thanks!

What com port is it plugged into?
Make sure cable is plugged into radio all the way. You may have to push harder than you think you should.

Thanks,

If you are running Win XP, go to Control Panel, System, Hardware, Device Manager, Ports and see what Com Port Number is assigned. Then run the KG-UVD1P Program and select Communication Port. Your port should show as Bold- select it. Connect the cable to the radio and make SURE it is plugged in ALL the way. Try Program, Read from radio to upload the radio data to the computer. Sometimes I have to turn radio power off and on and sometimes it takes two or three upload tries before the radio responds.

From: steve_ve6vs
Topic: 1420 Message: 1421

You CAN unlock the band edges BUT from already trying it don't expect any success. The circuit board transmit amplifier is built with band-pass filters specific to the model you purchased.

With the 220 model you will not have the ability to do UHF.
The former "UHF" RX front end and TX components have been changed for 220 operations.

1425. Frequency Display - What's Your Choice?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-03 12:49:15 UTC
From: wouxunus
Topic: 1425 Message: 1425

As you know, when changing from Frequency Mode (VFO) to Channel Mode (Memory), the radio will default to displaying just the Channel Number.

If you could choose a different default, which would you prefer? Default to Frequency + Channel Number (CH FREQ) -or- Default to Channel Name (NAME)?

I am not sure if existing radios will be able to be changed or not, but Wouxun-China tells me they can change the default on my future orders. I'd like opinions to see which default would be the most popular.

Wouxun-China is developing a dual-band mobile radio. It is now in the engineering stages and you have a chance to influence the final product.

They have asked that I get your comments on features (hardware and software) you would like to see and pass them along to the engineers. So what would you like to have?

Keep in mind, some bells and whistles add to the costs of the final product. We all love our Wouxun HT's because they are fantastic radios but our first attraction was their low price.

You could make your wish list range from "must have" to "this would be a nice option". So let me see your hardware and software ideas that you would like passed along.

My first suggestion will be to make it a tri-band rig, but I don't know if that will fly at all. I will also suggest a memory card slot that could be used for memory programming among other things. Maybe we will be lucky and I'll see this a prototype of this new model when I visit them in October.

From: John Kalotai
Topic: 1426 Message: 1430

1. Same wide frequency range.

2. If triband then 220mhz 1st choice and 6m 2nd

3. SAME decode for NWS boadcast

4. Separate IFs for dual receive V/V U/U or V/U

5. Cross-band repeat

6. Remote control of features via DTMF

7. Removable control head preferably with commonly available connector (RJ22 or RJ45) for extension cable.

8. Remote control of Band, Memory Channel, VFO from MIC

I guess I have the est of the weekend to think on it.

John Kalotai

On Jul 3, 2010, at 9:12 AM, wouxunus wrote:

Wouxun-China is developing a dual-band mobile radio. It is now in the engineering stages and you have a chance to influence the final product.

They have asked that I get your comments on features (hardware and software) you would like to see and pass them along to the engineers. So what would you like to have?

Keep in mind, some bells and whistles add to the costs of the final product. We all love our Wouxun HT's because they are fantastic radios but our first attraction was their low price.

You could make your wish list range from "must have" to "this would be a nice option". So let me see your hardware and software ideas that you would like passed along.

My first suggestion will be to make it a tri-band rig, but I don't know if that will fly at all. I will also suggest a memory card slot that could be used for memory programming among other things. Maybe we will be lucky and I'll see this a prototype of this new model when I visit them in October.

>

- Generous heat sink/cooling so it could be used in data applications without heating problems @ 25W output. [MUST]

- An external data jack for TNC or sound card connection. Use the same connector and pinout as Yaesu/Icom. [MUST]

- Switchable power out with a low power around 5W. [VERY DESIREABLE]

- Better memory programming software so you can sort you list of frequencies as you make changes to them! Same file format as the HT would be great so you can load the same thing into both radios easily. [VERY DESIREABLE]

- Make squelch a front panel knob and not a menu setting. [MUST]

- Tri-band would be cool. [WOULD BE NICE]

At the risk of being flippant, me too.

1) Expand on the speech feedback available on the handheld, making all menu options and settings speak their values.

2) Be sure there's the ability to directly enter parameters, such as on the handheld.

3) Stick a beep in at the beginning of menus where they wrap around.

4) Four our low vision friends, several backlight/display color options would be nice, but understand if this would prohibitively raise the cost of the radio.

5) Some sort of audible indication of active band when the new band is selected.

So, I mean, really, expansion on the pretty good non-visual accessibility of the handheld.

And, you can bill this as safety features for drivers, too, as nonvisual status reports would allow the operator to keep his eyes on the road where they're supposed to be.

Dan I assume you are referring to "channel display way" in the "optional function" tab. I have tried changing this with both v1.13 and v1.15 and I still get a default to Channel Number. What's your method?

Ed,

Hope you will have a great 4th and I will second your thoughts on anything as you know these radios inside and out...I think that although a Triband and other things would add to the cost-theses radios will still be a great deal for those who know radios...Upgradeable firmware and card slot is definitely a great thing and maybe even better software like we discussed off group...I would think a Tri-band also would be wonderful for many reasons and Wouxun may lowball the price just to get a strong foothold against their more pricier competitors...

I would expect that most of the features of the h/h would be included.

- An SD memory slot is a great idea
- fix the CTCSS stopping on a busy channel without a matching tone
- more alpha characters INCLUDING dash and space
- Cross band repeat
- A better antenna connector, UHF, BNC ok, NO SMA or Moto Mini-uhf, neither of those connectors will stay seated with vehicle vibration. Voice of experience.
- Control functions on the mike
- Programmable through the mike jack, able to accept my existing tw files

The rest of my ideas, DStar and the like cost money

I would say make a simple one and an advanced one.

Simple could be:
-SAME weather or at least weather alert (1050hz tone
-Individual channel settings (each channel having its own power setting, display name or frequency, etc)
-channel scan or skip being able to set easy.
- plus all the normal things

Advanced- All the same but maybe:
-APRS
-more bands
-cross band repeat
-all the cool things that would bring it up in cost.

Kevin

It'd be great if there could be a built in packet TNC. I never understood why that one feature pumps up the price of other radios so much other than just because they can. It'd be all kinds of great if APRS could be used to beacon repeater info so you can find repeaters automatically as you drive. I know this is getting way off topic in reference to radio features however.

A removable control head with common connector like RJ45 would be very nice. Especially if it can carry mic and speaker audio.

External port for up to 9600baud data. (Discriminator please!)

RS232 rig control? I'd like to plug it into my computer and control all the features of the radio from software.

Sound card interface

Crossband

Dual IF for Dual receive.

If not tri-band then 2m/440 2m/220 versions like their current handheld. 2m/900mhz in my dreams.

Programmable, like a programmable calculator.. also in my dreams.

Timed CWID

IF it is open outside of our bands, I'd like the ability to lock out the extended TX with a passcode. Enter passcode, get access.

More than 2 or 3 power levels if possible?

Dual volume controls and the ability to have separate speakers (external is fine, stereo plug would be great) for each VFO along with full dual VFO monitoring capabilities. Mini Din standard plug for packet interface should be on the list too.

Big issue to correct in a mobile would be the scan not stopping of frequency activity if the PL code does not match.

Cross band repeat would be nice.

VHF low Band (40-56 MHz or so) version would be nice too but that may be asking a bit too much.

1. Airband RX.

2. If triband - 4m please! (Just don't use an IF near 70MHz, at least then it can be added later)

3. Proper dual RX (full duplex)

4. Removable control head preferably with commonly available connector (RJ22 or RJ45) for extension cable.

5. Easy to program.

6 - and most controverstial - make it play MP3s from a memory stick, make it RX Medium Wave and FM, and make it fit a normal DIN sized car stereo slot. Then it can replace a car stereo completely.

THIS!!!!!!!!!!!

with cross band repeat and you have a radio that will be a BIG contender with yaesu,icom and kenwood. especially if it performs like this HT.

You'd have to buy an adapter, since the sma is kind of backwards. I have an aftermarket antenna I picked up at Hamvention... probably a homebre jobbie.. I'm still looking for my dual band Diamond antenna. I am unsure of any antennas that have an SMA male, like this radio needs without an adapter.

Ed.. so glad to have you with us and Wouxun confiding in you... I gotta order more stuff from you :)

The "must haves" have to include all the features we see now in our HT's (except those HT-specific)
Also.. low cost... significantly below the curtrent "big 3" prices.

"Nice options" in order of priority:
1: Tri-Band capacity (Cost factor?)
2: True Dual receiver (cost factor?)
3: Digital operation (D-star, which due to licensing costs for the Chip, is a *deflinite* cost factor)

As we can see,
Wouxun designed the radios with a cost factor in mind. Going overboard could make these radios not cost-effective for us.

They have a good thing going, and if done right, could upset the amateur market drastically in favor of us "broke hams"

I would like to see a 50 watt (or higher) mobile. With Dual Band 144, & 440 Mhz. As well as all of the things that are in the HT. And maybe add 220 mhz if a Tri-Bander. But make certain that Wouxun keeps their same High Quality. And a little easier to program. All at a LOW price. Thanks Ed!

THIS!!!!!!!!!!!

with cross band repeat and you have a radio that will be a BIG contender with yaesu,icom and kenwood. especially if it performs like this HT.

Mine works great with the factory antenna. I bought a telescoping dual band antenna for it but the factory antenna is essentially as good.
The real antenna improvement I see is with my dual band mag mount on the SUV and my dual band home antenna on the roof.

I bought a really nice SMA-F to BNC-F from www.radioshop888.com
I fits against the radio top so the SMA on the radio doesn't take all the load.

As a ZL ham, I would like to see a basic (ie low cost) dual band radio very similar in function to the handheld but with some of the firmware changes I would like to see on the handheld.
Make it possible to turn on the radio without the dual receive running. I would want to run it as single receive only.
Able to switch to memory mode with selectable display (in my case NAME)
Mini DIN data port.
Adjustable power out in at least 3 steps (50, 25, 5 watts) and power out remembered for each memory.
CTCSS separate frequency for encode and decode. Able to select decode CTCSS without having to have encode enabled.
If scanning, must only stop on correct CTCSS tone if that is in use.
Able to remove control head and use standard easily made extension cable (RJ series connectors).
If internal speaker is on the case, then able to attach the control head either way up so internal speaker is facing up or down.

A more expensive version would be full dual band with separate receivers and able to cross band.
Dual audio out for separate speakers on each receiver.

A slightly larger version could have a front panel mounted speaker and be designed to fit a standard auto DIN radio space for in dash mounting.

Adding the 220MHz band is of no interest to hams outside the USA so not a requirement and would add considerably to the cost.

Ensure the frequency selection knob is low on the front panel so your hand does not obscure the display when adjusting it. The Yaesu FT8800 etc for example, has the frequency control at the top and you can't adjust the control without obscuring the display.

Just some initial thoughts.

A lot of you have posted wish lists for all types of bells and whistles for a Wouxun mobile dual-band radio. And I bet you want to pay only $100 for it, too. Ain't happenin'!

I, for one, would be perfectly happy to have a mobile version of the KG-UVD1P handheld with all the same features and programmability so I can use the same programming for the handhelds for the mobile version. That would allow almost cloning, even if you have to use the software. It would make it easy to maintain a fleet.

If Wouxun were to come out with a mobile dual-bander, I'd probably purchase up to four of the radios, if not more. I hope they move forward and keep pushing in the U.S. market.

Hi Chuck,

Of course we expect to pay more than $100; at least, I would, if for no other reason than for the higher transmit power output. I'd be happy with a radio that has similar functionality to the handheld, but as I say, I really want expanded nonvisual feedback. I see this as more than just a nice to have, but as a necessity, not only for blind and visually impaired hams, but for sighted hams who should be watching where they're pointing their deathmobiles instead of watching their radio screens.

To expand on my earlier answer (I was in a rush!):

A Yaesu 8800 is ?300 here in the UK - features AM/airband RX, full duplex, 900MHz and 200-300MHz RX, proper wide/narrow (including RX), full aphanumeric memories, cross band repeater and 50/40W output.

Obviously you'd need to beat that.

The FT-7800 is the 'simplex' version, at ?250.

Shouldn't be difficult to beat that. Shouldn't be a problem.

What I DONT want to see is the confusing and ultimately useless 'dual standby' garbage that the UVD1 is cursed with.

Also, don't mess up the DTMF tones again like happened on my Mk1 UVD1P - which I'm stuck with.

Low power settings - 10W MUST be one of them. Foundation Licence holders in the UK are limited to 10W. Rigs with either 5W or 25W are just plain annoying!

I'd think at a lower price, 25W would be adequate - but there will be those that disagree. Of course - more power probably means a bigger price tag.

Obviously, there's a market for a super-cheap 'basic' dual bander like the 7800, and there's also a market for the 8800 type with proper dual RX.

220MHz is US and Canada only - and so would be very popular there, but totally useless anywhere else in the world.

Likewise, 4m isn't available there yet, but is gaining use in Europe and Africa fast - helped by the Wouxun handy for it as well. A 4m mobile would be very popular here - check www.70mhz.org for a current list of countries that are allowed it.

As for my suggestion of a 'stereo replacement' rig - a very nice idea, I'd certainly buy at least 2 straight off. You'd have have a 4 channel amplifier and a preamp output, as it's to take the place of a car stereo. You'd have to put some kind of audio mixer IC in to split the rig's output in with the stereos' - having one or the other is no good (as you can't listen for a call while using the radio/MP3 player then - this is what killed the tape player/CB combis that were once sold in mainland Europe) You'd also have to think very carefully about 'how' it works - I have several Chinese double DIN head units and they all seem

to have one little quirk that drives you crazy!

The 'stereo replacement' rig wouldn't need a removeable faceplate - although for the other rigs this is highly desirable, but makes designing the rig more of a challenge and production more expensive - as you probably need some kind of multplexer arrangement to pass all the control and display data down 4-8 wires. Certainly worth the price premium in modern cars though, as finding somewhere to put the rig is a nightmare.

if I think of anything else, I'll pass it on.

I'm certainly going to do some scribbles about the DIN size rig though. I've long thought that since MP3 is a big deal these days, it would be very easy to make a dual band rig and MP3/broadcast radio combi.

Dan I assume you are referring to "channel display way" in the "optional function" tab. I have tried changing this with both v1.13 and v1.15 and I still get a default to Channel Number. What's your method?

What we need is a good High Power Dual Bander. Say 75 watts (and not less than 50 watts) with 3-4 power levels, Cooling fan, Alpha Numeric display, Separation kit with the phone cable type (like Yaesu's) this way it can fit it any vehicle made, and still have plenty of punch. And about 200 or more Channel Memory & all tones. All in a Heavy Duty Chassis to stand up to being in a Big Truck. These are must haves. And everything that the HT's have. All at a great price like the HT's are. This would be the best Mobile Dual Bander around for both Simplex and Repeaters. With the 75 watts and a good antenna one could talk more miles than most other radios. And have all of the best features ever made.

Wouxun-China is developing a dual-band mobile radio. It is now in the engineering stages and you have a chance to influence the final product.

They have asked that I get your comments on features (hardware and software) you would like to see and pass them along to the engineers. So what would you like to have?

Keep in mind, some bells and whistles add to the costs of the final product. We all love our Wouxun HT's because they are fantastic radios but our first attraction was their low price.

You could make your wish list range from "must have" to "this would be a nice option". So let me see your hardware and software ideas that you would like passed along.

My first suggestion will be to make it a tri-band rig, but I don't know if that will fly at all. I will also suggest a memory card slot that could be used for memory programming among other things. Maybe we will be lucky and I'll see this a prototype of this new model when I visit them in October.

Software features:

Use the Windows clipboard for copy and paste. Able to insert a channel. Able to insert channel lineup for other Wouxun radios and as an added bonus, other brand radios. How about merge of radio data files?

Thanks,

Michael H. Cox

I can hit repeaters 100 miles away mobile with my 50 watt yaesu FT-7800r (dual band). But can't always hold them. I have a 75 watt Yaesu Ft-7900 (2 meter) and I can hit most repeaters within 100 miles away all day long. It's just to large for most vehicles made today. So driving around in a Big Rig 75 watts should work very well. With my Diamond SG-7900A antenna. I'm thinking the 75 will make the perfect Simplex radio if it could be made with a separation kit. And if you buy a good antenna you will hear good too! Maybe if you were mobile more you would see why I said 75 watts. And yes I do hear very well with the ears at home or Mobile.

I agree. At least here in the Midwest I don't notice a lot of difference between 25W and 50W so I doubt 75W would do much other than inflate the price tag.

OK so do I understand this correctly. In the "optional function" tab on the "channel display way" slot, you choose "Channel + Name", which you save and write to your radio?

You turn on your radio and the display starts up showing the Name + Channel Number. What happens if you press MENU + TDR and then MENU + TDR again? Are you then displaying Channel Number only or are you displaying Name + Channel Number? When I do this I default back to Channel Number only.

If they did RJ45 connectors then the seperation kit should be a mount and a cat5 cable.

hi ed
living in the uk i feel that a lot of people would buy and economy level tri band mobile on 2 meters 70cms and 6 meters that would be ideal with possibly fm and ssb at around 45 watts

and low power of around 5 watts with easy programing that can read acess and excel files would be great,and not too many bells and whistles,

colin G1NXI nottingham uk

10 watts though, not 5..... or both!

No chance of getting an SSB rig out of China yet - although there's
currently no such thing as a cheap (or even affordable) 2m/70cm SSB rig.
Megabucks or get a shack in the box.

just go to menu 21 and set it back your using a software shortcut and that is what it does toggles from channel to frequency and back

use menu 21 to change it and it goes where you want not where it wants too

OK Dan. I thought you had discovered some secret method. Using Menu 21 is what I'm trying to avoid... it's just an unnecessary step in my opinion. Especially since you have to Menu 21 both upper and lower displays. Wouxun says they can change it, so it's something I'm going to request. I will shoot for the user to be able to choose between the three readout types.

I agree, I have enough ideas to keep them busy. I'm compiling the list so after the PEZ dispenser, I won't be sending any updates to the engineer. I wonder if the PEZ should fit in the panel or the mic?

OK well good luck i have been trying to get them to fix the space problem with the software for about a year and a half

hope you can get it changed

1482. Re: [Wouxun_KG-UVD1] Re: If Wouxun made a dual-band mobile.....

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-04 19:37:10 UTC
From: Barry A. Baines
Topic: 1426 Message: 1482

Ed:

Over the past few days a number of suggestions have been made as what should be included in a mobile dual-band rig, including those that some might consider to be 'bells and whistles' as well as 'critical' features. The list must be pretty long by now and of course adding features will inevitably add to the retail price of a radio, not only due to development and manufacturing costs but also to what the producer evaluates to be the 'market price' for such features.

As we all realize, a key selling point of the Wouxun HT is the low retail cost. I suspect that as new models are introduced, there are no guarantees that these products will feature the same low price point as the current HT. Raising the price will perhaps discourage sales, so the seller must seek the 'sweet spot' in pricing a product where the buyer perceives appropriate 'value' which is a combination of both price and the product's features.

Given the input received to date, might I suggest that you take this process one step further and create a poll, using the polling feature of Yahoo! Groups, to list the features that have been suggested to date and ask list members to prioritize those features? If there are 15 features listed, for example, each person doing the poll would assign a number (#1 most important, #15 least important) to each of those features.

By creating a poll, you not only provide the engineers with a 'list', but one that identifies the relative importance of each feature. I would also suggest that you consider including a relative measurement of 'price' as another measure as well. We all want 'low prices', but what someone is willing to pay is based upon not only affordability but 'value'.

Consequently, one of the listed features should be 'price', where the list member could position 'price' on the priority list above or below the listed features, and thus create an evaluation of not only 'features' but a relative measure of where that 'low price' fits within the overall scheme of things. For example, placing 'price' as the #1 feature suggests that price drives the design and that the features listed on the poll are not as important as price. If price is chosen as the fifth priority, that would suggest that the user would be willing to pay a relatively higher price if features identified as priority #1-4 were included.

I suggest using this approach rather than listing suggested 'price points' because none of us have any idea what price points the manufacturer may consider to be 'realistic' and fixation of suggested retail price distorts the subjective evaluation that you'd want from those submitting input to the poll.

This is the first time that I've seen an amateur radio manufacturer seek direct input from users. This is a unique opportunity to provide input that could be made even more meaningful to the manufacturer by quantifying the results by using a survey of interested

users rather than simply providing a random 'wish list' that doesn't tell the engineers the relative importance of these features to the users.

Correct, no matter what I do or what my settings are it goes back to channel number. I have to manually go into menu 21 and change it back to name. It's pretty annoying.

I'm willing to bet that Yaesu/Vertex Standard, Kenwood, Icom and Alinco are reading these posts diligently. The WOUXUN pricing must certainly present them and their retailers with some headaches. A 2 meter/440 dual-band, Part 90-certified, FM handheld with basic accessories for $107.00 plus S&H from WOUXUN.US makes me wonder how badly we have been taking it in the shorts from the big guys for these past many years. Granted there are many functional and operational differences by comparison, but the WOUXUN price mitigates a lot of the "bells and whistles" for me!

I also hope that Bob, G4HFQ, is reading the mail here and that he may decide to take up a programming software project in the near future. I would be pleased to Beta Test for Bob once again.

I'm very pleased with the KG-UVD1P radio.

Hopefully Wouxun realizes this. My radio was $118 delivered with a handful of accessories from overseas. This was enough of a savings that I was willing to take a chance over a similarly featured radio from Icom/Kenwood/Yeasu. Even though I now have a favorable opinion of Wouxun (aside from their programming software!) I would probably not buy a dual-band radio from them just to save $20-$50 on a $275+ purchase I expect to last for years.

At $118 if the HT broke after a year and I couldn't get it fixed I can't say I'd be happy but it wouldn't be the end of the world. If I bought a 50W dual-band mobile it would have to be inexpensive enough to not worry too much about being an early adopter vs. paying more for a known quantity.

One day the Amateur community may perceive them to have the same level of quality and value as the "big three". That day is a ways off due lack of data points and experiences here in my opinion.

Wouxun is not the only dual bander out there, there are some other brands, if you just cruise thru ebay they pop up..... even if you would look for just 2m or 440 as a single band radio there are still some other brands for a cheap price.

Congrats!! Wouxun works great on all the fm LEO sats. Suggest you start with an antenna like the Arrow or Elk (both in the $120 range)or there are a number of articles out there covering some home brew designs. My prefered sat tracker is the free Orbitron software altough each has his/her own favorite. You may also want to download the programed sat frequencies found here in the files section. Have some 30+ states and 75-80 grids using the KG-UVD1p and the Elk antenna handheld.
Enjoy.

Hi friends,

I know how to use heavens-above.com to get orbital predictions for amateur satellites, and I see that at amsat.org there is info on ham satellite status... but I'm hoping someone who knows will post a list of which satellites might possibly be worked from a handheld radio with its standard antenna.

Thanks!

David / K7DB

Topic: 1423 Message: 1492

David:

The AMSAT website (www.amsat.org) has detailed information on each of the satellites that are currently operational and designed for use as 'FM birds' that can be operated through an HT. In particular, the following satellites are designed operate in FM mode:

AO-51 (the most popular satellite)
AO-27
SO-50
SO-67
HO-68

Several of these satellites are capable of various modes of operation, so check to make certain that a particular satellite of interest is set for FM operation. For example, here is the page that provides the operating schedule of AO-51:
http://www.amsat.org/amsat-new/echo/CTNews.php

There are a number of introduction or beginner materials that you can review in order to get a better idea of operating procedures:
http://www.amsat.org/amsat-new/information/faqs/

There are also online pass prediction models available on the AMSAT website as well as software available for download: http://www.amsat.org/amsat-new/tools/

Finally, you can contact an AMSAT Area Coordinator that is near your location to get assistance in getting started in amateur satellites. Area Coordinators are AMSAT members who are willing to serve as 'elmers'. To find the area coordinator nearest to you, take a look at: http://www.amsat.org/amsat-new/information/ac.php

Given that these FM satellite are several hundred kilometers above the earth and that you need a good signal for the satellite to hear your uplink signal, an antenna with more gain than the stock antenna that comes with an HT is normally required. Also remember that a FM satellite acts basically as single channel FM repeater where anyone under the footprint of a particular satellite could be transmitting on the satellite uplink frequency. This means your uplink signal on two meters must be strong enough to not only be heard by the satellite, but strong enough to 'compete' against other uplinks and thus overcome the 'capture effect' that single channel FM 'repeaters' exhibit. Consequently, an antenna with some gain, such as the Arrow or Elk antennas that were mentioned in Steve's posting are popular with FM satellite users. You MIGHT hear the downlink on 70 cm with a HT using the stock antenna, but that will depend upon a number of factors and you will not likely have much success.

Hope this helps....

I used an antenna other than the stock antenna. I got it at Hamvention.. probably a homebrew jobbie. It works better on 2m then the stock.
I just program the uplink as the TX freq (with PL) and the downlink on the receive freq. Has worked for me.... naturally, I cannot compensate for doppler shift when using this method; but it does work.
I am, of course, new to this; but I will get more refined as time goes by.

Now that I know I can hit the sats; I know I am doing something right.. and it only gets easier from this point.

Oh.. I am certain they are looking at what is going on. Once QST gets their review finished and published, 'm sure they REALLY will be looking and listening.

This group gets more members by the day and more and more get sold by the day (I'm sure ED is happy.. hihi)

With Ed and Wouxun talking, it appears they have found a market they are very interested in exploring.....

Many folks my friends and I who have one have shown people have got a lot of folks interested.

Our Wouxuns have, in many cases, MORE bells and whistles, than a lot of the big 3 rigs. True we don't have the "auto repeater function'; but then again, these are designed for commercial use,

The Puxing PX-777 is approved (there is a vhf and uhf moded.. but only one is approved)
As for the rest.... nope. Some hams are using all the multitudes of other radios; but unless the all-important FCC ID is there, then no one should touch them at all... I like it when I get my wouxun box that has an FCC logo on it :) The radio I got from Ed has the FCC ID on the radio....

Of course.... other Chinese comapnies may see the light and join the bandwagon and jump on board.... then what will happen? Just like the "Big 3" automakers, the other manufacturers will trounce them.

As for us hams.... We win :)

I have monitored AO-51 AO-27 and HO-68 succesfully using just the stock antenna, for st pass prediction im using tracsat on my pda which is just as portable as my wouxon and also it's a free download.

Subject: Re: [Wouxun_KG-UVD1] Re: Just had my first satellite contact!

David:

The AMSAT website (www.amsat.org) has detailed information on each of the satellites that are currently operational and designed for use as 'FM birds' that can be operated through an HT. In particular, the following satellites are designed operate in FM mode:

AO-51 (the most popular satellite)
AO-27
SO-50
SO-67
HO-68

Several of these satellites are capable of various modes of operation, so check to make certain that a particular satellite of interest is set for FM operation. For example, here is the page that provides the operating schedule of AO-51:
http://www.amsat.org/amsat-new/echo/CTNews.php

There are a number of introduction or beginner materials that you can review in order to get a better idea of operating procedures:
http://www.amsat.org/amsat-new/information/faqs/

There are also online pass prediction models available on the AMSAT website as well as software available for download: http://www.amsat.org/amsat-new/tools/

Finally, you can contact an AMSAT Area Coordinator that is near your location to get assistance in getting started in amateur satellites. Area Coordinators are AMSAT members who are willing to serve as 'elmers'. To find the area coordinator nearest to you, take a look at: http://www.amsat.org/amsat-new/information/ac.php

Given that these FM satellite are several hundred kilometers above the earth and that you need a good signal for the satellite to hear your uplink signal, an antenna with more gain than the stock antenna that comes with an HT is normally required. Also remember that a FM satellite acts basically as single channel FM repeater where anyone under the footprint of a particular satellite could be transmitting on the satellite uplink frequency. This means your uplink signal on two meters must be strong enough to not only be heard by the satellite, but strong enough to 'compete' against other uplinks and thus overcome the

'capture effect' that single channel FM 'repeaters' exhibit. Consequently, an antenna with some gain, such as the Arrow or Elk antennas that were mentioned in Steve's posting are popular with FM satellite users. You MIGHT hear the downlink on 70 cm with a HT using the stock antenna, but that will depend upon a number of factors and you will not likely have much success.

Hope this helps....

Very problamatic but AO-51 and perhaps AO-27 would offer your best bet.

Yes, the Puxing radios have type acceptance, but they don't have a dualband one. In note with some interest that the big three haven't figured out how to make a handheld give any sort of voice readout and Puxing and Wouxun have. So, what, the other guys can't be bothered or what?

What, on a handheld? Sorry, been a ham for 22 years and I've never seen a handheld with voice readout. Several mobiles from Kenwood and Icom, yes, even one from Yaesu (who can never be bothered, it seems), but never on a handheld. Not in the 22 years I've been hanging around these here parts anyway. Mobiles with voice readouts are not uncommon though, at least, not for dualband ones. Most notably, Kenwood seems to do the most in this area at the moment with their latest offerings.

Hi guys,

new to the group, stumbled across the Wouxun on ebay by accident & couldn't believe my eyes when I saw the price - be placing one on order tomorrow (from China, as I'm in Europe) - especially as looking at the archives I see I can program it from linux.

Regarding antennas, check out the Amsat site at http://www.amsat.org/amsat-new/information/faqs/ for quick & easy homebrew antennas.

I'd better add an antenna adapter to that order. ;)

This is news to me; I owned, and loved, the FT-530. I know many blind hams who likewise owned the '530. Never had I heard of any voice module, plugin or otherwise, for this rig, and I can guarantee you if we knew about it, lots of blind people would have bought them. You can't sell 'em if you don't bother to let anyone know they're available. Twenty years later, this is the first I'd heard such a thing was available, and believe me, if they were at all publicized they would have been snapped up by the blind ham population. So if they didn't sell, it was because they weren't actually advertised.

> In the last 35 years as a ham, I know of four portables that had a voice option (plug in board). Those were the FT-530 (2 meters/70 centimeter) and the Icom IC-V21AT (2 meters/1 1/4 meters) both of which I still have (with the optional board installed) along with the Icom IC-W21AT (2 meters and 70 centimeters) and the Icom IC-Delta 1A (2 meters/70 centimeters/23 centimeters). These rigs with the option came out in the early '90s. These options apparently we not very popular as they seemed to disappear as an option after less than a year. I checked with Icom and they told me they sold less than a dozen units worldwide before discontinuing the option.
>
> There were a slew of mobiles with that available option, but again, the option didn't last long. I guess it's a case of if you don't sell many of them, you don't make any more.

There areat least 5 of the MinDragon Rigs out there the Px777 plus vhf , the kg-uvd1P, kg-699e UHF , TH-F5. and TH-UVF1 all FCC type Accepted.

There many more with out the fcc but have ce label for EU some are great some are fair and a few are junk just to be nice.

These MinDragon rigs are worth investigating as the us market opens up to these rigs more will be type accepted to be sold here when the company's have sales in us they will get fcc testing done

I'm willing to bet that Yaesu/Vertex Standard, Kenwood, Icom and Alinco are reading these posts diligently. The WOUXUN pricing must certainly present them and their retailers with some headaches. A 2 meter/440 dual-band, Part 90-certified, FM handheld with basic accessories for $107.00 plus S&H from WOUXUN.US makes me wonder how badly we have been taking it in the shorts from the big guys for these past many years. Granted there are many functional and operational differences by comparison, but the WOUXUN price mitigates a lot of the "bells and whistles" for me!

I also hope that Bob, G4HFQ, is reading the mail here and that he may decide to take up a programming software project in the near future. I would be pleased to Beta Test for Bob once again.

I'm very pleased with the KG-UVD1P radio.

As I konw, the other wouxun UHF radios also has the FCC Authentication and the price is of course VERY competitive, like KG-699E, KG-669E, KG-639E.

I am not seeing any FCC IDs for any other Wouxun units. The KG-UVD1 is the only on listed... none of the models you mentioned have FCC approval.

I looked on the FCC OET site.

As I konw, the other wouxun UHF radios also has the FCC Authentication and the price is of course VERY competitive, like KG-699E, KG-669E, KG-639E.

A cursory Google search doesn't tell me anything so I'll ask.. What's the point of replacing the backlight with ultraviolet LEDs? Also, could that be dangerous to your eyesight? I honestly don't know, that's why I'm asking.

1517. Tri-Band KG-UVD1P 144 / 220 / 440 MHZ

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-07 18:16:43 UTC
From: k1kob
Topic: 1517 Message: 1517

OK guys, here is the scoop on adding 220MHZ to the KG-UVD1P and making it into a TRI-BANDER. First get the opening software off the internet. Then leave the 136 - 174 MHZ side alone. Open up the UHF side from 216 MHZ thru 520 MHZ. The HT will work on 220 and 440 bands... but.. you will need an antenna for the "new" 220 band. The easiest way to do this is to get a tri-band HT antenna. There are a couple on the market from about $30. to $40. US. I'm using the MFJ-1718S. It's a BIG rubber duckie. Program in your 144 MHZ, 220 MHZ, and 440 MHZ freqs and the KG-UVD1P is ready to go as a TRI-BANDER. The HT is not certified for this, but it will do FRS, GMRS, and don't forget to program in the NOAA weather freqs (don't put anything in the xmit column..that way you won't key up on the NOAA station). For the price, you can't beat this HT.
73, Ralph K1KOB

I would be interested to see what kind of power you are putting out in 222mhz. I've read in the past about other ham radios being able to be opened up to work on 222 but the power output was really marginal.

I'm not sure of the power on 220 mhz. The radio I used was the 144mhz / 220 mhz version. It was about $5.00 less than the 144/440 model. When I opened it up the 440 side worked just fine. I've had about five of these radios and sold them and made enough to have the current one for "free". It's nice that there is a US dealer now.

OK, exactly how do you open up the 144/220 model? I tried to program in a 440 frequency and save it to the radio and it responded that frequency was out of range.

There is an Unlock program that allows you to enter and save wider frequency ranges. I will upload a copy if it isn't already in the Files section

Look in FIles and use the 1KGxxx Unlock file

Topic: 1517 Message: 1524

You can get the display to show the frequency after you "unlock" the radio; but it will not transmit there. I actually tried mine; but there is zero output power. A scanner monitoring said extra freqs confirm there is no output.

Mileage may vary; but neither my 220 or 440 model will gou out of their designed bands.

OK, I did that and opened the upper range from 216 to 470 Mhz.. and then
using the programming software entered a 440 channel but it doesn't put out
any signal that I can hear on another radio tuned to the same frequency.

Actually, I think you have that backwards. I use AM slope detection to pick up FM on 10 meters works fine. I cannot see in any way how an FM receiver can pick up AM.

I think it would not work because aircraft are AM and this radio is FM.

Remember that the frequency setting stuff is sort of the radio control brain which is different from the RF sections which must be designed to work over the frequency range. I suspect the different radio models either have different RF components or at least are tuned differently. I am not aware of any Tuning Procedures or software for the KG-UVD1P.

right, nt sure i totally follow. i used the software in the files sectin and put in the figures, it is picking up things in the 118 upwards, not sure what it is just noise , lot of hissing. by changing it the radi will still be fine in the 440-470 yes? or have i cocked owt up?

I concur. The unlock software is only good for the designed frequencies. There are several different models, each having its own pre-programmed frequency range. For example, the USA only model just has the ham bands pre-set. You can, however, "unlock" the radio to give you more latitude.. but ONLY in the bands the RF sections are designed for.

1536. Suggestions for new KG-UVD1/KG-UVD1P Programming Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-07 22:16:29 UTC
From: fogger1969
Topic: 1536 Message: 1536

Hi Everyone,

I'm in the process of writing an application to program up the Wouxun KG-UVD1P radios. I can read and write to the radio already, and have written most of the code for how I think that it should work. But since we all use our radios a little differently, I though that it would be better if I asked for your feedback and suggestions before going any further.

One approach is to simply mirror what the current software does, but just fix the areas where it's deficient. This would be quite easy, but since I'm starting from scratch, why not improve on it. Hopefully wouxun will keep improving their own software.

My idea was to have groups or sets of frequencies that you pre-define. For example, 2m repeaters for a city in one set. Frequencies for working a particular satellite in another. These groups and individual frequencies can then be added to any number radio configurations in any combination. I hope that I'm explaining this clearly enough.

The software will not be free. I thought that it would be better to say so up front. But since it's a budget radio, it will be priced fairly. I'd like your feedback on the price as well. The tools that I use mean that there will be a native macintosh, windows, and linux version. One license will let you run all three versions. And I'd like to add support for other wouxun radios as they're released.

Let me know what you think.
Simon

You can set it back using the unlock software.

Hi Simon,

[Insert broken record here]

Please ensure accessibility, especially by allowing keyboard navigation of the controls. One should be able to use tab/shift+tab to navigate between controls, edit fields, etc., and arrow keys to modify settings, ideally.

There are free screen reader apps available if you care to try your softwarewith them. Of course, the Mac has Voiceover built in, activate with cmd+F5. For Windows, use the Web-based System Access to go at:
http://www.satogo.com

Or, download NVDA from:
http://www.nvda-project.org

For the GNOME desktop under GNU/Linux, look for orca.

I'm happy to see someone working on alternative programming software, as the Wouxun software is a bit fiddly with a screen reader. (This is an understatement.)

If you need help, let me know.

Hi Everyone,

I'm in the process of writing an application to program up the Wouxun KG-UVD1P radios. I can read and write to the radio already, and have written most of the code for how I think that it should work. But since we all use our radios a little differently, I though that it would be better if I asked for your feedback and suggestions before going any further.

One approach is to simply mirror what the current software does, but just fix the areas where it's deficient. This would be quite easy, but since I'm starting from scratch, why not improve on it. Hopefully wouxun will keep improving their own software.

My idea was to have groups or sets of frequencies that you pre-define. For example, 2m repeaters for a city in one set. Frequencies for working a particular satellite in another. These groups and individual frequencies can then be added to any number radio configurations in any combination. I hope that I'm explaining this clearly enough.

The software will not be free. I thought that it would be better to say so up front. But since it's a budget radio, it will be priced fairly. I'd like your feedback on the price as well. I'm glad to see ham radio is alive and well again. They say you can give a ham a eletric screw driver for Christmas and he will build an antenna out of it. I have been keeping up with this tri-band mod thread and I'm Enjoying it!

Most of these MinDragons Like the KG-UVD1P and software Driven and offer several posibitles of things for a ham to play with. I have seen a Hardware mod on the audio too.

Just get it to receive between 30 and 500 MHZ and you got a good scanner.

You can never tell and remember " if it dont work the first time your aboute normal."

I agree... while stuff may not work.. it is ALWAYS worth it to try :) If we gave up, the hobby would be no fun. We can only give our

opinions and experiences to help. How many times have we failed in our attempts, only to succeed in the end?? In the process we gained more knowlege.

Never give up.... in ham radio, the impossible is only something someone hasn't figured out yet :)

Get the "printing bug" fixed to allow USA folks to print out properly.
Get the Chinese-English language conversion right, so we can be more able to
understand functions.
Of course, any "hidden stuff" Wouxun omitted from their software would be nice
:) Of course, it needs discovered first...

If it is a really big improvement, I can pay... I understand a totally new
ground to be broken can cost a lot of time and effort...

Thanks for your interest in this project :)

Simon,

I for one would pay for quality software made by someone who is known to us in the group and would have our input. Although, Wouxun is "improving" its software there does not seem to be a clear goal. They hit upon some great ideas and then focus on some new ones and forget to include the great ideas in the next version of the programming software. I look forward to hearing what others have to say and who knows you may well be able to incorporate all these "unlock" things mentioned but do not seem to work well from radio to radio...Some of it is firmware issues and some of it appears to be software programming issues.. Also, to have the software that will work with the three main OS's would be excellent..Write On, My Brother Hammer!!!!!!!!!

Hi Simon,
One suggestion would be to integrate programming of the radio and the unlock function in the same software, we currently have to use two different programs to do that! Write it in Java or something that make it possible to run it on windows, Mac and Linux is great!
I don't know if you are going to use you own file format for import / export, but having the possibility to import / export to the current tw file format would be nice so that we can send file to those that don't have your program.
Thanks,

/JM

Nice project!

First of all, I'd suggest that you take a look at the FTBasicMMO software by Bob Freeth - he does a very nice program for Yaesu and others but seems to be (he told me some months ago) too busy with programs for the "big 3" to do Wouxon just yet. As a price guide, he charges £10/US$15 for his.

Import/export to an Excel file and Cloning

"Groups" is good

Default, but over-ridable repeater shifts for each band

Good luck, and keep us posted!

Stu
